

u-blox 8 / u-blox M8

Receiver Description Including Protocol Specification

Abstract

The Receiver Description Including Protocol Specification describes the firmware features, specifications and configuration for u-blox 8 / u-blox M8 high performance positioning modules.

The Receiver Description provides an overview and conceptual details of the supported features.

The Protocol Specification describes the NMEA and RTCM protocols as well as the UBX protocol (version 15.00 up to 19.10, version 20.00 to 20.30, version 22.00 and version 23.00 to 23.01) and serves as a reference manual. It includes the Standard Precision GNSS, Time Sync, Time & Frequency Sync, High Precision GNSS, ADR and UDR products.

Document Information

| | | |
|--------------------------|---|---------------|
| Title | u-blox 8 / u-blox M8 Receiver Description | |
| Subtitle | Including Protocol Specification v15-20.30,22-23.01 | |
| Document type | Manual | |
| Document number | UBX-13003221 | |
| Revision and date | R12 (c9f0122) | 28 April 2017 |
| Document status | Early Production Information | |

Document status explanation

| | |
|------------------------------|--|
| Objective Specification | Document contains target values. Revised and supplementary data will be published later. |
| Advance Information | Document contains data based on early testing. Revised and supplementary data will be published later. |
| Early Production Information | Document contains data from product verification. Revised and supplementary data may be published later. |
| Production Information | Document contains the final product specification. |

This document applies to the following products:

| Product name | Type number | Firmware version | Product category |
|--------------|----------------|------------------|-------------------------|
| CAM-M8C | CAM-M8C-0-10 | SPG 3.01 | Standard Precision GNSS |
| CAM-M8Q | CAM-M8Q-0-10 | SPG 3.01 | Standard Precision GNSS |
| EVA-M8M | EVA-M8M-0-10 | SPG 3.01 | Standard Precision GNSS |
| EVA-M8M | EVA-M8M-1-10 | SPG 3.01 | Standard Precision GNSS |
| EVA-M8Q | EVA-M8Q-0-10 | SPG 3.01 | Standard Precision GNSS |
| MAX-M8C | MAX-M8C-0-10 | SPG 3.01 | Standard Precision GNSS |
| MAX-M8Q | MAX-M8Q-0-10 | SPG 3.01 | Standard Precision GNSS |
| MAX-M8W | MAX-M8W-0-10 | SPG 3.01 | Standard Precision GNSS |
| NEO-M8M | NEO-M8M-0-10 | SPG 3.01 | Standard Precision GNSS |
| NEO-M8N | NEO-M8N-0-10 | SPG 3.01 | Standard Precision GNSS |
| NEO-M8Q | NEO-M8Q-0-10 | SPG 3.01 | Standard Precision GNSS |
| NEO-M8Q | NEO-M8Q-01A-10 | SPG 3.01 | Standard Precision GNSS |
| LEA-M8S | LEA-M8S-0-10 | SPG 3.01 | Standard Precision GNSS |
| SAM-M8Q | SAM-M8Q-0-10 | SPG 3.01 | Standard Precision GNSS |
| ZOE-M8G | ZOE-M8G-0-10 | SPG 3.01 | Standard Precision GNSS |
| EVA-8M | EVA-8M-0-10 | SPG 3.01 | Standard Precision GNSS |
| MAX-8C | MAX-8C-0-10 | SPG 3.01 | Standard Precision GNSS |
| MAX-8Q | MAX-8Q-0-10 | SPG 3.01 | Standard Precision GNSS |

| | | | |
|---------|--------------|----------|-------------------------|
| NEO-8Q | NEO-8Q-0-10 | SPG 3.01 | Standard Precision GNSS |
| NEO-M8P | NEO-M8P-0-10 | HPG 1.40 | High Precision GNSS |
| NEO-M8P | NEO-M8P-2-10 | HPG 1.40 | High Precision GNSS |
| EVA-M8E | EVA-M8E-0-11 | UDR 1.00 | Dead Reckoning |
| NEO-M8U | NEO-M8U-0-10 | UDR 1.00 | Dead Reckoning |
| NEO-M8T | NEO-M8T-0-10 | TIM 1.10 | Timing |
| LEA-M8T | LEA-M8T-0-10 | TIM 1.10 | Timing |
| LEA-M8F | LEA-M8F-0-00 | FTS 1.01 | Timing |

| Preface | 1 |
| 1 Document Overview | 1 |
| 2 Firmware and Protocol Versions..... | 1 |
| 2.1 How to determine the version and the location of the firmware | 1 |
| 2.1.1 Decoding the boot screen (for Protocol Version 17 and below)..... | 1 |
| 2.1.2 Decoding the boot screen (for Protocol Version 18 and above)..... | 3 |
| 2.1.3 Decoding the output of UBX-MON-VER (for Protocol Version 17 and below) | 4 |
| 2.1.4 Decoding the output of UBX-MON-VER (for Protocol Version 18 and above) | 6 |
| 2.2 How to determine the supported protocol version of the u-blox receiver..... | 7 |
| 2.3 u-blox 8 / u-blox M8 Firmware and Supported Protocol Versions | 7 |
| Receiver Description | 9 |
| 3 Receiver Configuration..... | 9 |
| 3.1 Configuration Concept | 9 |
| 3.2 Organization of the Configuration Sections | 10 |
| 3.3 Permanent Configuration Storage Media | 10 |
| 3.4 u-blox Receiver Default Configuration..... | 11 |
| 3.5 Save-on-Shutdown Feature | 11 |
| 4 Concurrent GNSS..... | 12 |
| 4.1 GNSS Types | 12 |
| 4.1.1 Major GNSS..... | 12 |
| 4.1.2 Augmentation Systems..... | 13 |
| 4.2 Configuration | 13 |
| 4.2.1 Switching between GNSS..... | 14 |
| 4.2.2 Configuring QZSS L1SAIF | 14 |
| 5 SBAS Configuration Settings Description | 14 |
| 5.1 SBAS (Satellite Based Augmentation Systems) | 14 |
| 5.2 SBAS Features | 16 |
| 5.3 SBAS Configuration..... | 17 |
| 6 IMES Description | 18 |
| 6.1 IMES Features | 18 |
| 7 Navigation Configuration Settings Description..... | 18 |
| 7.1 Platform settings | 18 |
| 7.2 Navigation Input Filters | 19 |
| 7.3 Navigation Output Filters | 20 |
| 7.3.1 Speed (3-D) Low-pass Filter | 20 |
| 7.3.2 Course over Ground Low-pass Filter | 20 |
| 7.3.3 Low-speed Course Over Ground Filter | 21 |
| 7.4 Static Hold | 21 |
| 7.5 Freezing the Course Over Ground | 21 |

| | |
|---|-----------|
| 7.6 Degraded Navigation..... | 21 |
| 7.6.1 2D Navigation..... | 21 |
| 7.7 Geodetic Coordinate Systems and Ellipsoids | 22 |
| 8 Clocks and Time..... | 22 |
| 8.1 Receiver Local Time | 22 |
| 8.2 Navigation Epochs..... | 23 |
| 8.3 iTOW Timestamps | 24 |
| 8.4 GNSS Times | 24 |
| 8.5 Time Validity..... | 24 |
| 8.6 UTC Representation | 25 |
| 8.7 Leap Seconds | 25 |
| 8.8 Real Time Clock | 25 |
| 8.9 Date..... | 26 |
| 8.9.1 GPS-only Date Resolution | 26 |
| 9 Broadcast Navigation Data..... | 26 |
| 9.1 Parsing Navigation Data Subframes | 27 |
| 9.2 GPS | 27 |
| 9.3 GLONASS..... | 27 |
| 9.4 BeiDou | 28 |

Preface

1 Document Overview

The Receiver Description Including Protocol Specification is an important resource for integrating and configuring u-blox receivers. This document has a modular structure and it is not necessary to read it from the beginning to the end. There are two main sections: The Receiver Description and the Protocol Specification.

The *Receiver Description* describes the software aspects of system features and configuration of u-blox receivers. The Receiver Description is structured according to areas of functionality, with links provided to the corresponding NMEA and UBX messages, which are described in the Protocol Specification.

The *Protocol Specification* is a reference describing the messages used by the u-blox receiver and is organized by the specific NMEA, UBX, and RTCM messages.

 *This document provides general information on u-blox receivers. Some information might not apply to certain products. Refer to the product Data Sheet and/or Hardware Integration Manual for possible restrictions or limitations.*

2 Firmware and Protocol Versions

The protocol version defines a set of messages that are applicable across various u-blox products. Each firmware used by a u-blox receiver supports a specific protocol version, which is not configurable.

The following sections will explain how to decode the shown information to get the firmware and the protocol version.

2.1 How to determine the version and the location of the firmware

The u-blox receiver can run a firmware from two different locations:

- Internal ROM
- External Flash memory

The location and the version of the currently running firmware can be found in the boot screen or in the UBX-MON-VER message.

For firmware supporting [Protocol Version 17 and below](#):

- [Boot screen, Protocol Version 17 and below](#)
- [UBX-MON-VER, Protocol Version 17 and below](#)

For firmware supporting [Protocol Version 18 and above](#):

- [Boot screen, Protocol Version 18 and above](#)
- [UBX-MON-VER, Protocol Version 18 and above](#)

2.1.1 Decoding the boot screen (for Protocol Version 17 and below)

Boot screen for a u-blox receiver running from ROM:

```

```

Not every line is output by every u-blox receiver in the boot screen. This depends on the product, the firmware location and the firmware version.

Possible lines in the boot screen and their meanings:

| Entry | Description |
|--|---|
| u-blox AG - www.u-blox.com | Start of the boot screen |
| HW UBX-M80xx 00800000 | Hardware version of the u-blox receiver (u-blox M8 receiver) |
| ROM CORE 2.01 (75331) Oct 29 2013 13:28:17 | Firmware version 2.01 running from ROM (revision number) compilation date/time |
| EXT CORE 2.01 (75350) Oct 29 2013 16:15:41 | Firmware version 2.01 running from Flash (revision number) compilation date/time |
| ROM BASE 2.01 (75331) Oct 29 2013 13:28:17 | Underlying firmware version 2.01 in ROM (revision number) compilation date/time |
| PROTVER 15.00 | Supported protocol version |
| GNSS OTP: GPS GLO, SEL: GPS GLO | Default Major GNSS selection. Current Major GNSS selection. |
| ANTSUPERV=AC SD PDoS SR | Configuration of the Antenna supervisor where AC: Active Antenna Control enabled SD: Short Circuit Detection enabled OD: Open Circuit Detection enabled PDoS: Short Circuit Power Down Logic enabled SR: Automatic Recovery from Short state |
| LLC FFFFFFFF-FF7F7C3F- FFFFFF96-FFFFFFF-FFFFFFF79 | Low-level configuration of the u-blox receiver. |
| FIS 0xEF4015 (100111) found | Flash Information Structure (FIS) file for Flash memory with JEDEC 0xEF4015 found in the external flash memory. Revision number of the file is indicated in brackets. |

Possible lines in the boot screen and their meanings: continued

| Entry | Description |
|------------|------------------------------------|
| RF0 dev ok | RF channel 0 configured correctly. |

The line containing the CORE indicates which version of the firmware is currently running. The firmware is running either from ROM (indicated with ROM CORE) or from external Flash memory (indicated with EXT CORE).

The line containing the CORE is called **firmware string** in the rest of the document.

2.1.2 Decoding the boot screen (for Protocol Version 18 and above)

Boot screen for a u-blox receiver running from ROM:

```

09:15:59 $GNTXT,01,01,02,PF=3FB*4F
  
```

Not every line is output by every u-blox receiver in the boot screen. This depends on the product, the firmware location and the firmware version.

Possible lines in the boot screen and their meanings:

| Entry | Description |
|----------------------------|---|
| u-blox AG - www.u-blox.com | Start of the boot screen |
| HW UBX-M8030 00800000 | Hardware version of the u-blox receiver (u-blox M8 receiver) |
| HW UBX-G8020 00800000 | Hardware version of the u-blox receiver (u-blox 8 receiver) |
| ROM CORE 3.01 (107888) | Firmware version 3.01 running from ROM (revision number) |
| EXT CORE 3.01 (107900) | Firmware version 3.01 running from Flash (revision number) |

Possible lines in the boot screen and their meanings: continued

| Entry | Description |
|--|--|
| ROM BASE 3.01 (107888) | Underlying firmware version 3.01 in ROM (revision number) |
| FWVER=SPG 3.01 | Firmware of product category and version where SPG: Firmware of Standard Precision GNSS product HPG: Firmware of High Precision GNSS product ADR: Firmware of ADR product UDR: Firmware of UDR product TIM: Firmware of Time Sync product FTS: Firmware of Time & Frequency Sync product |
| PROTVER=18.00 | Supported protocol version |
| MOD=NEO-M8N-0 | Module identification. Set in production. |
| FIS=0xEF4015 (100111) | Flash Information Structure (FIS) file for Flash memory with JEDEC 0xEF4015 found in the external flash memory. Revision number of the file is indicated in brackets. |
| GPS ; GLO ; GAL ; BDS | Supported Major GNSS . |
| SBAS ; IMES ; QZSS | Supported Augmentation systems . |
| GNSS OTP=GPS ; GLO | Default Major GNSS selection. |
| LLC FFFFFFFF-FFFFFFFF- FFFFFFF-FFFFFFF-FFCFFFFF | Low-level configuration of the u-blox receiver. |
| ANTSUPERV=AC SD PDoS SR | Configuration of the Antenna supervisor where AC: Active Antenna Control enabled SD: Short Circuit Detection enabled OD: Open Circuit Detection enabled PDoS: Short Circuit Power Down Logic enabled SR: Automatic Recovery from Short state |
| PF=3FF | Product configuration. |

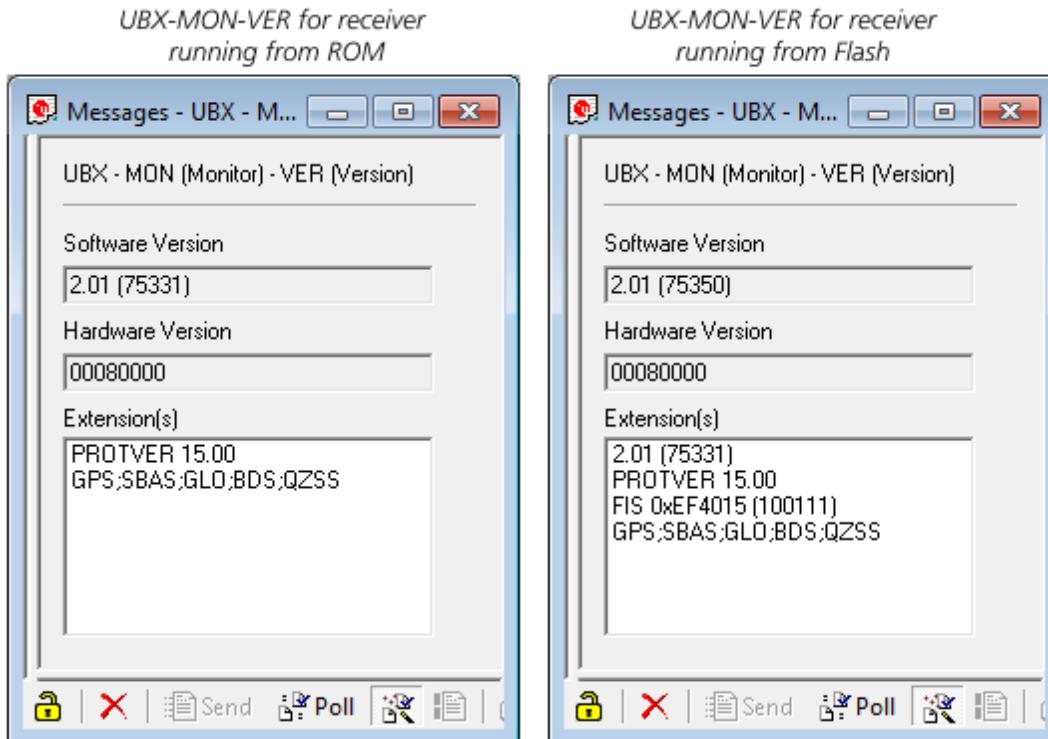

The line containing the FWVER indicates which version of the firmware is currently running and is called **firmware version** in the rest of the document.

The numbers in parentheses (revision numbers) should only be used to identify a known firmware version and are not guaranteed to increase over time.

2.1.3 Decoding the output of UBX-MON-VER (for Protocol Version 17 and below)

Possible fields in UBX-MON-VER and their meanings:

| Entry | Description |
|------------------|--|
| Software Version | Currently running firmware version. If no firmware version is shown in the first line of Extension(s), then the u-blox receiver runs from ROM . If a firmware version is shown in the first line of Extension(s), then the u-blox receiver runs from Flash . |
| Hardware Version | The hardware version of the u-blox receiver. |
| Extension(s) | Extended information about the u-blox receiver firmware. See table below for the entries. |

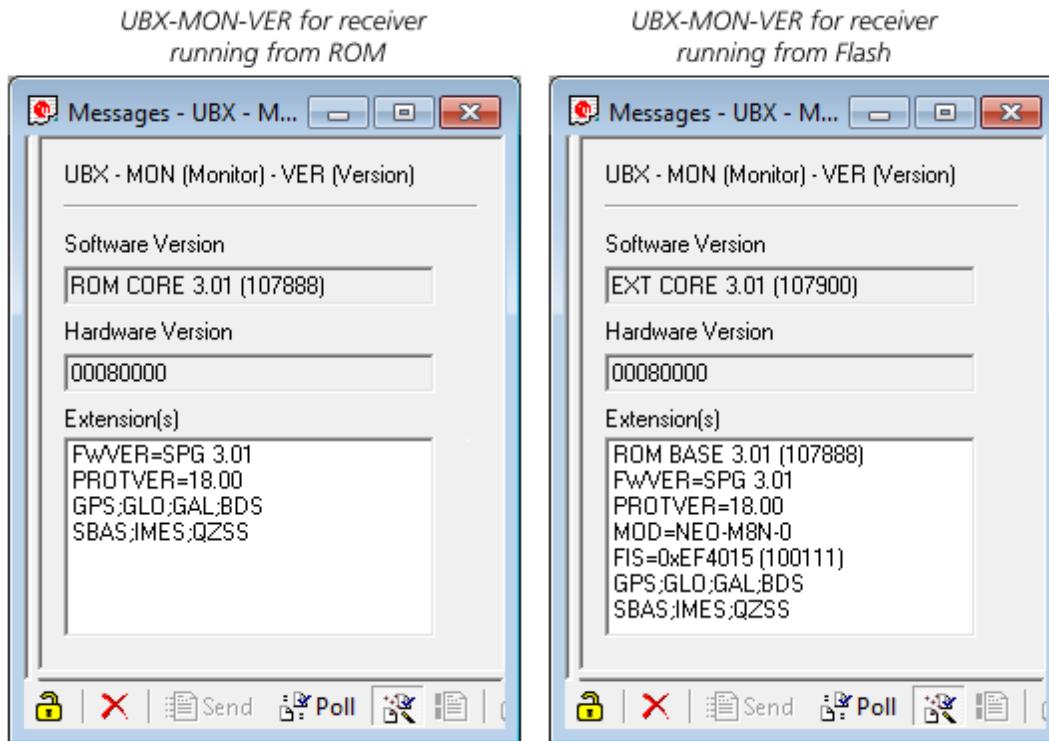

Not every entry is output by every u-blox receiver in the UBX-MON-VER extensions. This depends on the product, the firmware location and the firmware version.

Possible entries in UBX-MON-VER Extension(s):

| Entry | Description |
|-----------------------|---|
| 2.01 (75331) | Underlying firmware version in ROM. If such an entry is present, then the u-blox receiver runs from Flash . |
| PROTVER 15.00 | Supported protocol version. |
| FIS 0xEF4015 (100111) | Flash Information Structure (FIS) file for Flash memory with JEDEC 0xEF4015 found in the external flash memory. Revision number of the file is indicated in brackets. |
| MOD NEO-M8N-0 | Module identification. Set in production. |
| GPS;SBAS;GLO;BDS;QZSS | Supported GNSS. |

2.1.4 Decoding the output of UBX-MON-VER (for Protocol Version 18 and above)

Possible fields in UBX-MON-VER and their meanings:

| Entry | Description |
|------------------------|---|
| Software Version | Currently running firmware version. |
| ROM CORE 3.01 (107888) | If ROM CORE, then the u-blox receiver runs from ROM . |
| EXT CORE 3.01 (107900) | If EXT CORE, then the u-blox receiver runs from Flash . |
| Hardware Version | The hardware version of the u-blox receiver. |
| Extension(s) | Extended information about the u-blox receiver firmware. See table below for the entries. |

Not every entry is output by every u-blox receiver in the UBX-MON-VER extensions. This depends on the product, the firmware location and the firmware version.

Possible entries in UBX-MON-VER Extension(s):

| Entry | Description |
|------------------------|--|
| ROM BASE 3.01 (107888) | Underlying firmware version in ROM. If such an entry is present, then the u-blox receiver runs from Flash . |
| FWVER=SPG 3.01 | Firmware of product category and version where SPG: Firmware of Standard Precision GNSS product HPG: Firmware of High Precision GNSS product ADR: Firmware of ADR product UDR: Firmware of UDR product TIM: Firmware of Time Sync product FTS: Firmware of Time & Frequency Sync product |
| PROTVER=18.00 | Supported protocol version. |
| MOD=NEO-M8N-0 | Module identification. Set in production. |

Possible entries in UBX-MON-VER Extension(s): continued

| Entry | Description |
|-----------------------|---|
| FIS=0xEF4015 (100111) | Flash Information Structure (FIS) file for Flash memory with JEDEC 0xEF4015 found in the external flash memory. Revision number of the file is indicated in brackets. |
| GPS ; GLO ; GAL ; BDS | Supported Major GNSS . |
| SBAS ; IMES ; QZSS | Supported Augmentation systems . |

2.2 How to determine the supported protocol version of the u-blox receiver

Each u-blox receiver reports its supported protocol version in the following ways:

- On start-up in the [boot screen](#)
- In the [UBX-MON-VER message](#)

with the line containing PROTVER (example: PROTVER=18.00).

Additionally, the *firmware string* can be used to look up the corresponding protocol version. The tables below give an overview of the released firmware and their corresponding protocol versions.

2.3 u-blox 8 / u-blox M8 Firmware and Supported Protocol Versions

Firmware for Standard Precision GNSS products

| Firmware version | Firmware string | Protocol Version |
|------------------|--|------------------|
| SPG 2.01 | ROM CORE 2.01 (75331) Oct 29 2013 13:28:17 | 15.00 |
| SPG 2.01 | EXT CORE 2.01 (75350) Oct 29 2013 16:15:41 | 15.00 |
| SPG 3.01 | ROM CORE 3.01 (107888) | 18.00 |
| SPG 3.01 | EXT CORE 3.01 (107900) | 18.00 |
| SPG 3.50 | EXT CORE 3.50 (190461) | 23.00 |
| SPG 3.51 | ROM CORE 3.51 (19dc23) | 23.01 |
| SPG 3.51 | EXT CORE 3.51 (19dc23) | 23.01 |

High Precision GNSS Firmware

| Firmware version | Firmware string | Protocol Version |
|------------------|------------------------|------------------|
| HPG 1.00 | EXT CORE 3.01 (111160) | 20.00 |
| HPG 1.11 | EXT CORE 3.01 (b8bc67) | 20.01 |
| HPG 1.20 | EXT CORE 3.01 (d34ed4) | 20.10 |
| HPG 1.30 | EXT CORE 3.01 (d080e3) | 20.20 |
| HPG 1.40 | TO BE CONFIRMED | 20.30 |

Firmware for Dead Reckoning products

| Firmware version | Firmware string | Protocol Version |
|------------------|---|------------------|
| ADR 3.00 | EXT CORE 2.01 (77076) Dec 18 2013 09:40:24 ADR 3.00 | 15.00 |
| ADR 3.10 | EXT CORE 2.01 (87683) Nov 21 2014 14:03:10 ADR 3.10 M8L | 15.01 |
| ADR 3.11 | EXT CORE 2.01 (89981) Jan 20 2015 17:22:06 ADR 3.11 M8L | 15.01 |
| ADR 4.00 | EXT CORE 3.01 (16559bf) Apr 21 2016 15:49:07 ADR 4.00 | 19.00 |
| ADR 4.10 | EXT CORE 3.01 (c0c787c) Apr 24 2017 17:31:42 ADR 4.10 | 19.10 |
| UDR 1.00 | EXT CORE 3.01 (16559bf) Apr 21 2016 15:50:59 UDR 1.00 | 19.00 |

Firmware for Timing products

| <i>Firmware version</i> | <i>Firmware string</i> | <i>Protocol Version</i> |
|-------------------------|--|-------------------------|
| FTS 1.01 | EXT CORE 2.20 (81289) May 14 2014 14:11:24 | 16.00 |
| TIM 1.00 | EXT CORE 2.30 (85522) Sep 29 2014 09:40:12 | 17.00 |
| TIM 1.01 | EXT CORE 2.30 (86283) Oct 20 2014 13:51:49 | 17.00 |
| TIM 1.02 | EXT CORE 2.30 (93796) Apr 8 2015 15:53:38 | 17.00 |
| TIM 1.10 | EXT CORE 3.01 (111141) | 22.00 |

Receiver Description

3 Receiver Configuration

3.1 Configuration Concept

u-blox receivers are fully configurable with UBX protocol configuration messages (message class UBX-CFG). The configuration used by the u-blox receiver during normal operation is termed "Current Configuration". The Current Configuration can be changed during normal operation by sending any UBX-CFG-XXX message to the u-blox receiver over an I/O port. The u-blox receiver will change its Current Configuration immediately after receiving the configuration message. The u-blox receiver always uses only the Current Configuration.

Unless the Current Configuration is made permanent by using [UBX-CFG-CFG](#) as described below, the Current Configuration will be lost when there is:

- a power cycle
- a hardware reset
- a (complete) controlled software reset

See the [section on resetting a u-blox receiver](#) for details.

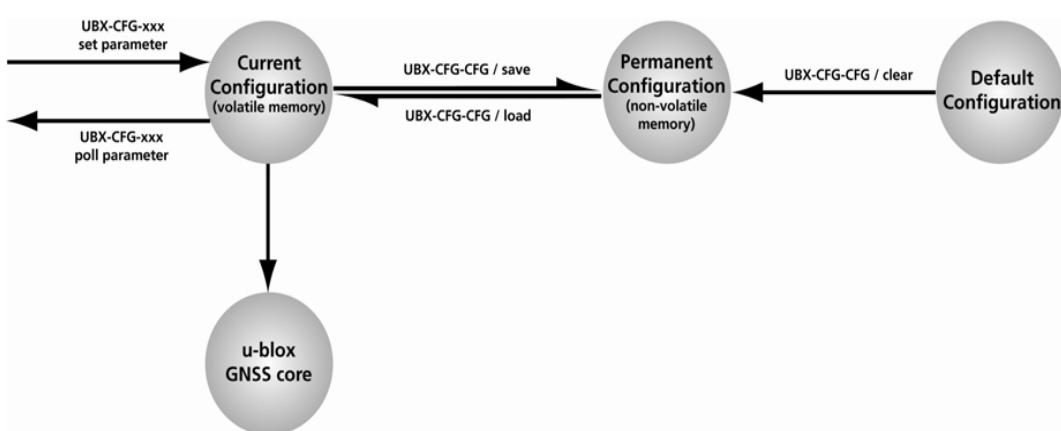

The Current Configuration can be made permanent (stored in a non-volatile memory) by saving it to the "Permanent Configuration". This is done by sending a [UBX-CFG-CFG](#) message with an appropriate **saveMask** (UBX-CFG-CFG/save).

The Permanent Configuration is copied to the Current Configuration during start-up or when a [UBX-CFG-CFG](#) message with an appropriate **loadMask** (UBX-CFG-CFG/load) is sent to the u-blox receiver.

The Permanent Configuration can be restored to the u-blox receiver's Default Configuration by sending a [UBX-CFG-CFG](#) message with an appropriate **clearMask** (UBX-CFG-CFG/clear) to the u-blox receiver. This only replaces the Permanent Configuration, not the Current Configuration. To make the u-blox receiver operate with the Default Configuration which was restored to the Permanent Configuration, a UBX-CFG-CFG/load command must be sent or the u-blox receiver must be reset.

The mentioned masks (saveMask, loadMask, clearMask) are 4-byte bitfields. Every bit represents one configuration sub-section. These sub-sections are defined in section "[Organization of the Configuration Sections](#)". All three masks are part of every UBX-CFG-CFG message. Save, load and clear commands can be combined in the same message. Order of execution is: clear, save, load.

The following diagram illustrates the process:

It is possible to change the current communications port settings using a [UBX-CFG-CFG](#) message. This could

affect baud rate and other transmission parameters. Because there may be messages queued for transmission there may be uncertainty about which protocol applies to such messages. In addition a message currently in transmission may be corrupted by a protocol change. Host data reception parameters may have to be changed to be able to receive future messages, including the acknowledge message associated with the UBX-CFG-CFG message.

3.2 Organization of the Configuration Sections

The configuration is divided into several sub-sections. Each of these sub-sections corresponds to one or several UBX-CFG-XXX messages. The sub-section numbers in the following tables correspond to the bit position in the masks mentioned above. All values not listed are reserved

Configuration sub-sections

| Number | Name | CFG messages | Description |
|--------|------|--|---|
| 0 | PRT | UBX-CFG-PRT UBX-CFG-USB | Port and USB settings |
| 1 | MSG | UBX-CFG-MSG | Message settings (enable/disable, update rate) |
| 2 | INF | UBX-CFG-INF | Information output settings (Errors, Warnings, Notice, Test etc.) |
| 3 | NAV | UBX-CFG-NAV5 UBX-CFG-NAVX5 UBX-CFG-DAT UBX-CFG-RATE UBX-CFG-SBAS UBX-CFG-NMEA UBX-CFG-TMODE2 | Settings for Navigation Parameters, Receiver Datum, Measurement and Navigation Rate, SBAS, NMEA protocol and Time mode (Timing products only) |
| 4 | RXM | UBX-CFG-GNSS UBX-CFG-TP5 UBX-CFG-RXM UBX-CFG-PM2 UBX-CFG-ITFM | GNSS Settings, Power Mode Settings, Time Pulse Settings, Jamming/Interference Monitor Settings |
| 9 | RINV | UBX-CFG-RINV | Remote Inventory configuration |
| 10 | ANT | UBX-CFG-ANT | Antenna configuration |
| 11 | LOG | UBX-CFG-LOGFILTER | Logging configuration |
| 12 | FTS | UBX-CFG-DOSC UBX-CFG-ESRC UBX-CFG-SMGR | Disciplining configuration. Only applicable to the Time & Frequency Sync product. |

3.3 Permanent Configuration Storage Media

The Current Configuration is stored in the volatile RAM of the u-blox receiver. Hence, any changes made to the Current Configuration without saving will be lost if any of the reset events listed in the section above occur. By using UBX-CFG-CFG/save, the selected configuration sub-sections are saved to all non-volatile memories available:

- On-chip BBR (battery backed RAM). In order for the BBR to work, a backup battery must be applied to the u-blox receiver.
- External flash memory, where available.

3.4 u-blox Receiver Default Configuration

The Permanent Configuration can be reset to Default Configuration through a [UBX-CFG-CFG/clear](#) message. The Default Configuration of the u-blox receiver is normally determined when the u-blox receiver is manufactured. Refer to specific product data sheet for further details.

3.5 Save-on-Shutdown Feature

The save-on-shutdown feature (SOS) enables the u-blox receiver to store the contents of the battery-backed RAM to external flash memory and restore it upon startup. This allows the u-blox receiver to preserve some of the features available only with a battery backup (preserving configuration and satellite orbit knowledge) without having a battery backup supply present. It does not, however, preserve any kind of time knowledge. The save-on-shutdown must be commanded by the host. The restore-on-startup is automatically done if the corresponding data is present in the flash. No expiration check of the data is done.

The following outlines the suggested shutdown procedure when using the save-on-shutdown feature:

- The host commands the u-blox receiver to stop using the [UBX-CFG-RST](#) message, specifying reset mode 0x08 ("Controlled GNSS stop") and a BBR mask of 0 ("Hotstart").
- The u-blox receiver confirms the reception of a valid / invalid request with a [UBX-ACK-ACK](#) / [UBX-ACK-NAK](#) message.
- The host commands the saving of the contents of BBR to the flash memory using the [UBX-UPD-SOS-BACKUP](#) message.
- The u-blox receiver confirms the reception of a valid / invalid request with a [UBX-ACK-ACK](#) / [UBX-ACK-NAK](#) message.
- For a valid request the u-blox receiver reports on the success of the backup operation with a [UBX-UPD-SOS-ACK](#) message.
- The host powers off the u-blox receiver.

And consequently the startup procedure is as follows:

- The host powers on the u-blox receiver.
- The u-blox receiver detects the previously stored data in flash. It restores the corresponding memory and reports the success of the operation with a [UBX-UPD-SOS-RESTORED](#) message on the port it had received the save command message (if the output protocol filter on that port allows it). It does not report anything if no stored data has been detected.
- Additionally the u-blox receiver outputs a [UBX-INF-NOTICE](#) and/or a [NMEA-TXT](#) message with the contents RESTORED in the boot screen (depends on port and information messages configuration) upon success.
- Optionally the host can deliver coarse time assistance using [UBX-MGA-INI-TIME_UTC](#) for better startup performance.

Once the u-blox receiver has started up it is suggested to delete the stored data using a [UBX-UPD-SOS-CLEAR](#) message. The u-blox receiver responds with a [UBX-ACK-ACK](#) or [UBX-ACK-NAK](#) message.

Note that this feature must not be used with Power Save Mode and that saved data must be deleted before switching to that mode.

4 Concurrent GNSS

Many u-blox positioning modules and chips are multi-GNSS receivers capable of receiving and processing signals from multiple Global Navigation Satellite Systems (GNSS).

u-blox concurrent GNSS receivers are multi-GNSS receivers that can acquire and track satellites from more than one GNSS system at the same time, and utilize them in positioning.

4.1 GNSS Types

u-blox receivers support a wide range of different GNSS. Some GNSS have large numbers of satellites deployed globally and therefore are generally capable of providing navigation solutions on their own. u-blox designates these as "major GNSS". By contrast, some are designed to be used to enhance the use of one or more major GNSS and u-blox designates these "augmentation systems".

In many cases, such as [satellite numbering](#), this distinction does not matter as u-blox receivers generally try to combine information from all available GNSS to create the best possible navigation information. However, particularly in relation to [configuring the receiver](#), the distinction can be important.

4.1.1 Major GNSS

The major GNSS supported by u-blox receivers are described below.

4.1.1.1 GPS

The Global Positioning System (GPS) is a GNSS operated by the US department of defense. Its purpose is to provide position, velocity and time for civilian and defense users on a global basis. The system currently consists of 32 medium earth orbit satellites and several ground control stations.

4.1.1.2 GLONASS

GLONASS is a GNSS operated by Russian Federation department of defense. Its purpose is to provide position, velocity and time for civilian and defense users on a global basis. The system consists of 24 medium earth orbit satellites and ground control stations.

It has a number of significant differences when compared to GPS. In most cases, u-blox receivers operate in a very similar manner when they are configured to use GLONASS signals instead of GPS. However some aspects of receiver output are likely to be noticeably affected.

4.1.1.3 Galileo

At the time of writing (early 2016), the Galileo system was still under development with only a few fully operational SVs. Therefore, the precise performance and reliability of u-blox receivers when receiving Galileo signals is effectively impossible to guarantee.

Galileo is a GNSS operated by the European Union. Its purpose is to provide position, velocity and time for civilian users on a global basis. The system is currently not fully operational. It is eventually expected to consist of 30 medium earth orbit satellites.

On u-blox M8 receivers a maximum of ten channels can be assigned to Galileo for signal acquisition and tracking. Note that at most eight Galileo satellites will be used for navigation. It is recommended not to set the number of Galileo channels higher than eight in [UBX-CFG-GNSS](#).

4.1.1.3.1 Search and Rescue Return Link Message

The receiver supports reception and output of Search and Rescue (SAR) Return Link Messages (RLM). When enabled, a [UBX-RXM-RLM](#) message will be generated whenever an RLM is detected by the receiver.

At the time of writing (early 2016), no live transmission of RLMs by Galileo SVs had been observed, so the details of their use was impossible to verify completely.

4.1.1.4 BeiDou

BeiDou is a GNSS operated by China. Its purpose is to initially provide position, velocity and time for users in Asia. In a later stage when the system is fully deployed it will have worldwide coverage. The full system will consist of five geostationary, five inclined geosynchronous and 27 medium earth orbit satellites, as well as control, upload and monitoring stations. Although this implies a full constellation of 37 SVs, only SVs numbered 1 to 30 are fully supported in the D1/D2 NAV message described by the Interface Control Document version 2.0. For SVs numbered above 30, there is currently no almanac or differential correction. Consequently, u-blox receivers only use BeiDou SVs numbered 1 to 30.

4.1.2 Augmentation Systems

The augmentation systems supported by u-blox receivers are described below.

4.1.2.1 SBAS

There are a number of Space Based Augmentation Systems (SBAS) operated by different countries using geostationary satellites. u-blox receivers currently support the following:

- WAAS (Wide Area Augmentation System) operated by the US.
- EGNOS (European Geostationary Navigation Overlay Service) operated by the EU.
- MSAS (Multi-functional Satellite Augmentation System) operated by Japan.
- GAGAN (GPS Aided Geo Augmented Navigation) operated by India.

See section [SBAS](#) for more details.

4.1.2.2 QZSS

The Quasi Zenith Satellite System (QZSS) is a regional satellite augmentation system operated by [Japan Aerospace Exploration Agency](#) (JAXA). It is intended as an enhancement to GPS, to increase availability and positional accuracy. The QZSS system achieves this by transmitting GPS-compatible signals in the GPS bands. NMEA messages will show the QZSS satellites only if configured to do so (see section [Satellite Numbering](#)). The QZSS L1SAIF is an additional signal broadcast by QZSS satellites that contains augmentation and other data.

4.1.2.3 IMES

The Indoor MEssaging System (IMES) is an extension to the QZSS specification.

See section [IMES](#) for more details.

4.2 Configuration

The [UBX-CFG-GNSS](#) message allows the user to specify which GNSS signals should be processed along with limits on how many tracking channels should be allocated to each GNSS. The receiver will respond to such a request with a [UBX-ACK-ACK](#) message if it can support the requested configuration or a [UBX-ACK-NAK](#) message if not.

Customers enabling BeiDou and/or Galileo who wish to use the NMEA protocol are recommended to select NMEA version 4.1, as earlier versions have no support for these two GNSS. See the [NMEA protocol section](#) for details on selecting NMEA versions.

The combinations of systems which can be configured simultaneously depends on the receivers capability to

receive several carrier frequencies. The [UBX-MON-GNSS](#) message reports which major GNSS can be selected. Please refer to the data sheet of the corresponding u-blox receiver for full information. Usually GPS, SBAS (e.g. WAAS, EGNOS, MSAS), QZSS and Galileo can be enabled together, because they all use the 1575.42MHz L1 frequency. GLONASS and BeiDou both operate on different frequencies, therefore the receiver must be able to receive a second or even third carrier frequency in order to process these systems together with GPS.

It is recommended to disable GLONASS and BeiDou if a GPS-only antenna or GPS-only SAW filter is used.

In all circumstances, it is necessary for at least one [major GNSS](#) to be enabled. It is also required that at least 4 tracking channels are available to each enabled major GNSS, i.e. `maxTrkCh` must have a minimum value of 4 for each enabled major GNSS. Further requirements on generating configurations acceptable by the receiver can be found in [UBX-CFG-GNSS](#).

4.2.1 Switching between GNSS

Users should be aware that switching between GNSS (and especially away from GPS) may affect the long term accuracy of the receiver until the next [cold start](#). In normal operation the receiver selects the best models and corrections from the transmitted auxiliary data (e.g. UTC and Ionospheric parameters), basing this selection on the configured GNSS. Disabling a major GNSS prevents auxiliary data from that GNSS being refreshed and so it will become stale, resulting in progressively degraded performance. This can occur even if the main power supply is removed, as most receivers retain auxiliary data in non-volatile storage, e.g. Battery Backed RAM (BBR). For this reason, u-blox recommends that receivers are [cold started](#) after any change that disables an active GNSS, within a few weeks, but preferably immediately. This will ensure that the receiver then uses only regularly refreshed information from the newly configured constellations.

4.2.2 Configuring QZSS L1SAIF

By default the receiver will be configured for QZSS L1C/A, this can be changed so the receiver can be configured for QZSS L1SAIF also. See the table below for [UBX-CFG-GNSS](#) `sigCfgMask` settings for signals on QZSS. For example, to enable QZSS L1C/A and QZSS L1SAIF, set the `gnssId` to 5 (for QZSS) and `sigCfgMask` to 0x05. If supported by the firmware, L1SAIF would then be enabled.

QZSS Signal configuration for UBX-CFG-GNSS

| GnssId | Description | Signal mask |
|--------|-------------|---|
| 5 | QZSS | 0x01 = QZSS L1C/A 0x04 = QZSS L1SAIF |

5 SBAS Configuration Settings Description

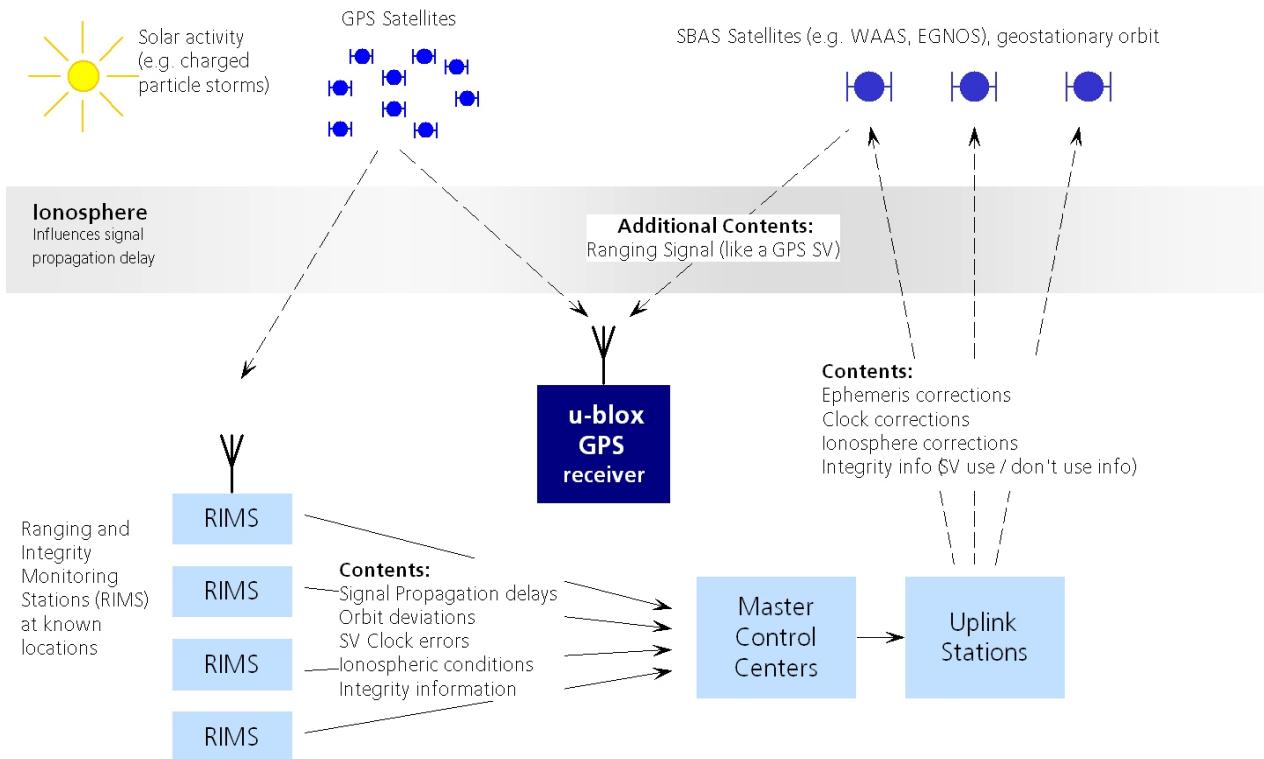

5.1 SBAS (Satellite Based Augmentation Systems)

SBAS (Satellite Based Augmentation System) is an augmentation technology for GPS, which calculates GPS integrity and correction data with RIMS (Ranging and Integrity Monitoring Stations) on the ground and uses geostationary satellites to broadcast GPS integrity and correction data to GPS users. The correction data is transmitted on the GPS L1 frequency (1575.42 MHz), and therefore no additional receiver is required to make use of the correction and integrity data.

u-blox receivers will only process corrections for GPS. Other corrections are not applied, even if, as planned, some SBAS satellites start to transmit them (e.g. SDCM for GLONASS).

SBAS Principle

There are several compatible SBAS systems available or in development all around the world:

- WAAS (Wide Area Augmentation System) for North America has been in operation since 2003.
- MSAS (Multi-Functional Satellite Augmentation System) for Japan has been in operation since 2007.
- EGNOS (European Geostationary Navigation Overlay Service) has been in operation since 2009.
- GAGAN (GPS Aided Geo Augmented Navigation), for India has been in operation since 2014.
- SDCM (System for Differential Corrections and Monitoring), for Russia is at the time of writing in test mode.

Support of SBAS allows u-blox GPS technology to take full advantage of the augmentation systems that are currently available (i.e. WAAS, EGNOS, MSAS, GAGAN). Signals from systems currently being tested and/or planned (such as SDCM) may also work, when those systems become fully operational, but this cannot be relied upon and u-blox receivers are not configured to support them by default.

With SBAS enabled, the user benefits from additional satellites for ranging (navigation). u-blox GPS technology uses the available SBAS satellites for navigation just like GPS satellites, if the SBAS satellites offer this service.

To improve position accuracy, SBAS uses different types of correction data:

- **Fast Corrections** for short-term disturbances in GPS signals (due to clock problems, etc).
- **Long-term corrections** for GPS clock problems, broadcast orbit errors etc.
- **Ionosphere corrections** for ionosphere activity

Another benefit of SBAS is the use of GPS integrity information. In this way SBAS control stations can 'disable' the use of GPS satellites within a 6-second alarm time in case of major GPS satellite problems. If integrity monitoring is enabled, u-blox GPS technology only uses satellites, for which integrity information is available.

For more information on SBAS and associated services, refer to the following resources:

- RTCA/DO-229D (MOPS). Available from www.rtca.org
- gps.faa.gov for information on WAAS.

- www.esa.int for information on EGNOS.
- www.essp-sas.eu for information about European Satellite Services Provider (ESSP), the EGNOS operations manager.
- www.isro.org for information on GAGAN.
- www.sdcn.ru for information on SDCM.

SBAS satellites tracked (as of November 2015)

| Identification | Position | GPS PRN | SBAS Provider |
|--------------------|----------|---------|---------------|
| AMR | 98° W | 133 | WAAS |
| PanAmSat Galaxy XV | 133.0° W | 135 | WAAS |
| TeleSat Anik F1R | 107.3° W | 138 | WAAS |
| Inmarsat 3F2 AOR-E | 15.5° W | 120 | EGNOS |
| Artemis | 21.5° W | 124 | EGNOS |
| Inmarsat 3F5 IOR-W | 25° E | 126 | EGNOS |
| MTSAT-1R | 140.1° E | 129 | MSAS |
| MTSAT-2 | 145° E | 137 | MSAS |
| Inmarsat-4F1/IOR | 64° E | 127 | GAGAN |
| GSAT-10 | 83° E | 128 | GAGAN |

5.2 SBAS Features

This u-blox SBAS implementation is, in accordance with standard RTCA/DO-229D, a class Beta-1 equipment. All timeouts etc. are chosen for the En Route Case. Do not use this equipment under any circumstances for "safety of life" applications!

u-blox receivers are capable of receiving multiple SBAS signals concurrently, even from different SBAS systems (WAAS, EGNOS, MSAS, etc.). They can be tracked and used for navigation simultaneously. Every tracked SBAS satellite utilizes one vacant receiver tracking channel. Only the number of receiver channels limits the total number of satellites used. Every SBAS satellite that broadcasts ephemeris or almanac information can be used for navigation, just like a normal GPS satellite.

For receiving correction data, the u-blox receiver automatically chooses the best SBAS satellite as its primary source. It will select only one since the information received from other SBAS satellites is redundant and/or could be inconsistent. The selection strategy is determined by the proximity of the satellites, the services offered by the satellite, the configuration of the receiver (Testmode allowed/disallowed, Integrity enabled/disabled) and the signal link quality to the satellite.

If corrections are available from the chosen SBAS satellite and used in the navigation calculation, the DGPS flag is set in the receiver's output protocol messages (see [NAV-PVT](#), [NAV-SOL](#), [NAV-STATUS](#), [NAV-SVINFO](#), [NMEA Position Fix Flags description](#)). The message [NAV-SBAS](#) provides detailed information about which corrections are available and applied.

The most important SBAS feature for accuracy improvement is ionosphere correction. The measured data from regional RIMS stations are combined to make a TEC (Total Electron Content) Map. This map is transferred to the receiver via the satellites to allow a correction of the ionosphere error on each received satellite.

Supported SBAS messages

| Message Type | Message Content | Source |
|--------------|---------------------|---------|
| 0(0/2) | Test Mode | All |
| 1 | PRN Mask Assignment | Primary |
| 2, 3, 4, 5 | Fast Corrections | Primary |

Supported SBAS messages continued

| Message Type | Message Content | Source |
|--------------|------------------------------------|---------|
| 6 | Integrity | Primary |
| 7 | Fast Correction Degradation | Primary |
| 9 | Satellite Navigation (Ephemeris) | All |
| 10 | Degradation | Primary |
| 12 | Time Offset | Primary |
| 17 | Satellite Almanac | All |
| 18 | Ionosphere Grid Point Assignment | Primary |
| 24 | Mixed Fast / Long term Corrections | Primary |
| 25 | Long term Corrections | Primary |
| 26 | Ionosphere Delays | Primary |

Each satellite services a specific region and its correction signal is only useful within that region. Planning is crucial to determine the best possible configuration, especially in areas where signals from different SBAS systems can be received:

Example 1: SBAS Receiver in North America

In the eastern parts of North America, make sure that EGNOS satellites do not take preference over WAAS satellites. The satellite signals from the EGNOS system should be disallowed by using the PRN Mask.

Example 2: SBAS Receiver in Europe

Some WAAS satellite signals can be received in the western parts of Europe, therefore it is recommended that the satellites from all but the EGNOS system should be disallowed using the PRN Mask.

Although u-blox receivers try to select the best available SBAS correction data, it is recommended to configure them to disallow using unwanted SBAS satellites.

The EGNOS SBAS system does not provide the satellite ranging function.

5.3 SBAS Configuration

To configure the SBAS functionalities use the UBX proprietary message [UBX-CFG-SBAS](#) (SBAS Configuration).

SBAS Configuration parameters

| Parameter | Description |
|--|--|
| Mode - SBAS Subsystem | Enabled / Disabled status of the SBAS subsystem. To enable/disable SBAS operation use UBX-CFG-GNSS . The field in UBX-CFG-SBAS is no longer supported. |
| Mode - Allow test mode usage | Allow / Disallow SBAS usage from satellites in Test Mode (Message 0) |
| Services/Usage - Ranging | Use the SBAS satellites for navigation |
| Services/Usage - Apply SBAS correction data | Combined enable/disable switch for Fast-, Long-Term and Ionosphere Corrections |
| Services/Usage - Apply integrity information | Use integrity data |
| Number of tracking channels | Should be set using UBX-CFG-GNSS . The field in UBX-CFG-SBAS is no longer supported. |
| PRN Mask | Allows selectively enabling/disabling SBAS satellites (e.g. restrict SBAS usage to WAAS-only). |

By default, SBAS is enabled with three prioritized SBAS channels and it will use any received SBAS satellites

(except for those in test mode) for navigation, ionosphere parameters and corrections.

6 IMES Description

Indoor MEssaging System (IMES) is an extension to the QZSS specification using ground based beacons that broadcast their location. Its purpose is to allow GNSS users to continue to navigate inside buildings, when they can no longer reliably receive satellite based signals.

Operation of IMES beacons is only allowed within Japan.

*u-blox receivers with IMES enabled conform to **IS-QZSS v1.5** and do not support v1.4 or earlier IMES signals. In particular, u-blox receivers rely on the IMES station's carrier frequency being 1575.4282MHz ± 0.2ppm as specified in the IMES specification. Transmissions from IMES stations that are not within this frequency range are unlikely to be reliably received. Also the receiver expects the preamble 0x9E as well as the correct sequence of CNT values as specified by the IS-QZSS.*

u-blox receivers report the position information they receive from IMES transmitters directly with [UBX-RXM-IMES](#). They do not, however, combine this information with navigation solutions derived from satellite signals (reported via various NMEA and UBX-NAV messages). Consequently, the IMES position information may not always be consistent with satellite signal derived position information.

6.1 IMES Features

- **50/250bps Auto-Detection:** Both 50bps and 250bps IMES signals are supported by u-blox receivers. The transmitter's data rate is detected automatically which allows the receiver to even work in a mixed 50bps/250bps IMES environment.
- **Dynamic Tracking Channel Allocation:** The allocation of the tracking channels is done dynamically, in the same way that channels are allocated to other GNSS. If sufficient IMES stations are within reach of the receiver, it will track as many signals as it can up to the value of `maxTrkCh` configured in [CFG-GNSS](#) (8 by default). To reserve a certain number of channels for IMES only (preventing them from being dynamically allocated to other GNSS), set the `resTrkCh` field in [CFG-GNSS](#) accordingly.
- **Data summary:** A summary of all the tracked IMES signals and what position information they are providing is given in the [UBX-RXM-IMES](#) message.
- **Raw IMES frames:** The raw IMES subframes received from the IMES stations are reported as they are received with [UBX-RXM-SFRBX](#) messages.

7 Navigation Configuration Settings Description

This section relates to the configuration message [UBX-CFG-NAV5](#).

7.1 Platform settings

u-blox receivers support different dynamic platform models (see table below) to adjust the navigation engine to the expected application environment. These platform settings can be changed dynamically without performing a power cycle or reset. The settings improve the receiver's interpretation of the measurements and thus provide a more accurate position output. Setting the receiver to an unsuitable platform model for the given application environment is likely to result in a loss of receiver performance and position accuracy.

Dynamic Platform Models

| Platform | Description |
|----------|--|
| Portable | Applications with low acceleration, e.g. portable devices. Suitable for most situations. |

Dynamic Platform Models continued

| Platform | Description |
|--------------|---|
| Stationary | Used in timing applications (antenna must be stationary) or other stationary applications. Velocity restricted to 0 m/s. Zero dynamics assumed. |
| Pedestrian | Applications with low acceleration and speed, e.g. how a pedestrian would move. Low acceleration assumed. |
| Automotive | Used for applications with equivalent dynamics to those of a passenger car. Low vertical acceleration assumed. |
| At sea | Recommended for applications at sea, with zero vertical velocity. Zero vertical velocity assumed. Sea level assumed. |
| Airborne <1g | Used for applications with a higher dynamic range and greater vertical acceleration than a passenger car. No 2D position fixes supported. |
| Airborne <2g | Recommended for typical airborne environments. No 2D position fixes supported. |
| Airborne <4g | Only recommended for extremely dynamic environments. No 2D position fixes supported. |
| Wrist | Only recommended for wrist worn applications. Receiver will filter out arm motion. (just available for protocol version > 17) |

Dynamic Platform Model Details

| Platform | Max Altitude [m] | MAX Horizontal Velocity [m/s] | MAX Vertical Velocity [m/s] | Sanity check type | Max Position Deviation |
|--------------|---------------------|----------------------------------|--------------------------------|-----------------------|------------------------|
| Portable | 12000 | 310 | 50 | Altitude and Velocity | Medium |
| Stationary | 9000 | 10 | 6 | Altitude and Velocity | Small |
| Pedestrian | 9000 | 30 | 20 | Altitude and Velocity | Small |
| Automotive | 6000 | 100 | 15 | Altitude and Velocity | Medium |
| At sea | 500 | 25 | 5 | Altitude and Velocity | Medium |
| Airborne <1g | 50000 | 100 | 100 | Altitude | Large |
| Airborne <2g | 50000 | 250 | 100 | Altitude | Large |
| Airborne <4g | 50000 | 500 | 100 | Altitude | Large |
| Wrist | 9000 | 30 | 20 | Altitude and Velocity | Medium |

Dynamic platforms designed for high acceleration systems (e.g. airborne <2g) can result in a higher standard deviation in the reported position.

If a sanity check against a limit of the dynamic platform model fails, then the position solution is invalidated. The table above shows the types of sanity checks which are applied for a particular dynamic platform model.

7.2 Navigation Input Filters

The navigation input filters in [CFG-NAV5](#) mask the input data of the navigation engine.

These settings are already optimized. Do not change any parameters unless advised by u-blox support engineers.

Navigation Input Filter parameters

| Parameter | Description |
|--------------------------|---|
| fixMode | By default, the receiver calculates a 3D position fix if possible but reverts to 2D position if necessary (Auto 2D/3D). The receiver can be forced to only calculate 2D (2D only) or 3D (3D only) positions. |
| fixedAlt and fixedAltVar | The fixed altitude is used if fixMode is set to 2D only. A variance greater than zero must also be supplied. |

Navigation Input Filter parameters continued

| Parameter | Description |
|-------------------------------|--|
| minElev | Minimum elevation of a satellite above the horizon in order to be used in the navigation solution. Low elevation satellites may provide degraded accuracy, due to the long signal path through the atmosphere. |
| cnoThreshNumSVs and cnoThresh | A navigation solution will only be attempted if there are at least the given number of SVs with signals at least as strong as the given threshold. |

See also comments in section [Degraded Navigation](#) below.

7.3 Navigation Output Filters

The result of a navigation solution is initially classified by the fix type (as detailed in the fixType field of [UBX-NAV-PVT](#) message). This distinguishes between failures to obtain a fix at all ("No Fix") and cases where a fix has been achieved, which are further subdivided into specific types of fixes (e.g. 2D, 3D, dead reckoning).

Where a fix has been achieved, a check is made to determine whether the fix should be classified as valid or not. A fix is only valid if it passes the navigation output filters as defined in [UBX-CFG-NAV5](#). In particular, both PDOP and accuracy values must lie below the respective limits.

Valid fixes are marked using the valid flag in certain NMEA messages (see [Position Fix Flags in NMEA](#)) and the gnssFixOK flag in [UBX-NAV-PVT](#) message.

Important: Users are recommended to check the gnssFixOK flag in the [UBX-NAV-PVT](#) or the NMEA valid flag. Fixes not marked valid should not normally be used.

The [UBX-NAV-SOL](#) and [UBX-NAV-STATUS](#) messages also report whether a fix is valid in their gpsFixOK and GPSfixOk flags. These messages have only been retained for backwards compatibility and users are recommended to use the [UBX-NAV-PVT](#) message in preference.

The [UBX-CFG-NAV5](#) message also defines TDOP and time accuracy values that are used in order to establish whether a fix is regarded as locked to GNSS or not, and as a consequence of this, which time pulse setting has to be used. Fixes that do not meet both criteria will be regarded as unlocked to GNSS, and the corresponding time pulse settings of [UBX-CFG-TP5](#) will be used to generate a time pulse.

7.3.1 Speed (3-D) Low-pass Filter

The [UBX-CFG-ODO](#) message offers the possibility to activate a speed (3-D) low-pass filter. The output of the speed low-pass filter is published in the [UBX-NAV-VELNED](#) message (speed field). The filtering level can be set via the [UBX-CFG-ODO](#) message (velLpGain field) and must be comprised between 0 (heavy low-pass filtering) and 255 (weak low-pass filtering).

Strictly speaking, the internal filter gain is computed as a function of speed. Therefore, the level as defined in the [UBX-CFG-ODO](#) message (velLpGain field) defines the nominal filtering level for speeds below 5m/s.

7.3.2 Course over Ground Low-pass Filter

The [UBX-CFG-ODO](#) message offers the possibility to activate a course over ground low-pass filter when the speed is below 8m/s. The output of the course over ground (also named *heading of motion 2-D*) low-pass filter is published in the [UBX-NAV-PVT](#) message (headMot field), [UBX-NAV-VELNED](#) message (heading field), [NMEA-RMC](#) message (cog field) and [NMEA-VTG](#) message (cogt field). The filtering level can be set via the [UBX-CFG-ODO](#) message (cogLpGain field) and must be comprised between 0 (heavy low-pass filtering) and 255 (weak low-pass filtering).

The filtering level as defined in the [UBX-CFG-ODO](#) message (cogLpGain field) defines the filter gain

for speeds below 8m/s. If the speed is higher than 8m/s, no course over ground low-pass filtering is performed.

7.3.3 Low-speed Course Over Ground Filter

The [UBX-CFG-ODO](#) message offers the possibility to activate a low-speed course over ground filter (also named *heading of motion 2-D*). This filter derives the course over ground from position at very low speed. The output of the low-speed course over ground filter is published in the [UBX-NAV-PVT](#) message (*headMot* field), [UBX-NAV-VELNED](#) message (*heading* field), [NMEA-RMC](#) message (*cog* field) and [NMEA-VTG](#) message (*cogt* field). If the low-speed course over ground filter is not activated or inactive, then the course over ground is computed as described in section [Freezing the Course Over Ground](#).

7.4 Static Hold

Static Hold Mode allows the navigation algorithms to decrease the noise in the position output when the velocity is below a pre-defined 'Static Hold Threshold'. This reduces the position wander caused by environmental factors such as multi-path and improves position accuracy especially in stationary applications. By default, static hold mode is disabled.

If the speed drops below the defined 'Static Hold Threshold', the Static Hold Mode will be activated. Once Static Hold Mode has been entered, the position output is kept static and the velocity is set to zero until there is evidence of movement again. Such evidence can be velocity, acceleration, changes of the valid flag (e.g. position accuracy estimate exceeding the Position Accuracy Mask, see also section [Navigation Output Filters](#)), position displacement, etc.

The [UBX-CFG-NAV5](#) message additionally allows for configuration of distance threshold (field *staticHoldMaxDist*). If the estimated position is farther away from the static hold position than this threshold, static mode will be quit.

7.5 Freezing the Course Over Ground

If the low-speed course over ground filter is deactivated or inactive (see section [Low-speed Course over Ground Filter](#)), the receiver derives the course over ground from the GNSS velocity information. If the velocity cannot be calculated with sufficient accuracy (e.g., with bad signals) or if the absolute speed value is very low (under 0.1m/s) then the course over ground value becomes inaccurate too. In this case the course over ground value is frozen, i.e. the previous value is kept and its accuracy is degraded over time. These frozen values will not be output in the NMEA messages [NMEA-RMC](#) and [NMEA-VTG](#) unless the NMEA protocol is explicitly configured to do so (see [NMEA Protocol Configuration](#)).

7.6 Degraded Navigation

Degraded navigation describes all navigation modes which use less than four Satellite Vehicles (SV).

7.6.1 2D Navigation

If the receiver only has three SVs for calculating a position, the navigation algorithm uses a constant altitude to compensate for the missing fourth SV. When an SV is lost after a successful 3D fix (min. four SVs available), the altitude is kept constant at the last known value. This is called a 2D fix.

u-blox receivers do not calculate any navigation solution with less than three SVs. Only u-blox Timing products can calculate a timing solution with only one SV when they are in stationary mode.

7.7 Geodetic Coordinate Systems and Ellipsoids

In order to have any useful meaning, the positions reported by a u-blox receiver must be referenced to some coordinate system which defines the origin and, for example, which way is "up". For many reasons, including history, practical autonomy and politics, all the major GNSS define their own theoretical coordinate systems from which they realize a practical reference frame by means of a network of reference points. Specifically:

- GPS uses WGS84
- GLONASS uses PZ90
- Galileo uses GTRF
- BeiDou uses CGCS2000

In practice, the relevant organisations choose to keep their respective frames very close to the International Terrestrial Reference Frame (ITRF), defined and managed by the International Earth Rotation and Reference Systems Service (IERS). However, because the Earth's tectonic plates and even parts of the Earth's core move, new versions of ITRF are defined every few years, generally with changes of the order of a few millimetres. Consequently, the major GNSS occasionally decide that they need to update their reference frames to be better aligned to the latest ITRF. So, for example, GPS switched to WGS84 (G1150) in GPS week 1150 (early 2002) based on ITRF2000, while GLONASS switched from PZ90.02 to PZ90.11 at the end of 2013, based on ITRF2008. The net effect of this, is that all the major GNSS use almost the same reference frame, but there are some small (generally sub-cm) differences between them and these differences occasionally change.

In order to produce positions that can be shown on a map, it is necessary to translate between raw coordinates (e.g. x, y, z) and a position relative to the Earth's surface (e.g. latitude, longitude and altitude) and that requires defining the form of ellipsoid that best matches the shape of the Earth. Historically many different ellipsoid definitions have been used for maps, many of which predate the existence of GNSS and show quite significant differences, leading to discrepancies of as much as 100m in places. Fortunately, most digital maps now use the WGS84 ellipsoid, which is distinct from the WGS84 coordinate system, but defined by the same body.

All u-blox receivers use (the current) version of WGS84 frame as their reference frame, carrying out any necessary corrections internally. What is more, by default, u-blox receivers use the WGS84 ellipsoid and therefore all positions communicated from/to a u-blox receiver will be relative to that. However, users can alter this by specifying their chosen geodetic datum parameters using the [UBX-CFG-DAT](#) message. The table below indicates the values u-blox recommends for use.

Recommended UBX-CFG-DAT parameters

| Ellipsoid | majA | flat | dX | dY | dZ | rotX | rotY | rotZ |
|-----------------|-----------|---------------|-----|-----|-----|------|------|------|
| WGS84 (default) | 6378137.0 | 298.257223563 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 |
| PZ90 | 6378136.0 | 298.257839303 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 |
| CGCS2000 | 6378137.0 | 298.257227101 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 |

Where the receiver is configured to use differential correction data (e.g. via an RTCM stream), as a direct consequence, the receiver's coordinate frame will switch to whatever frame the source of correction data is using.

8 Clocks and Time

8.1 Receiver Local Time

The receiver is dependent on a local oscillator (normally a TCXO or Crystal oscillator) for both the operation of its radio parts and also for timing within its signal processing. No matter what nominal frequency the local oscillator has (e.g. 26 MHz), u-blox receivers subdivide the oscillator signal to provide a 1 kHz reference clock

signal, which is used to drive many of the receiver's processes. In particular, the measurement of satellite signals is arranged to be synchronised with the "ticking" of this 1 kHz clock signal.

When the receiver first starts, it has no information about how these clock ticks relate to other time systems; it can only count time in 1 millisecond steps. However, as the receiver derives information from the satellites it is tracking or from aiding messages, it estimates the time that each 1 kHz clock tick takes in the time-base of the relevant GNSS system. In previous generations of u-blox receivers this was always the GPS time-base, but for this generation it could be GPS, GLONASS, Galileo, or BeiDou. This estimate of GNSS time based on the local 1 kHz clock is called **receiver local time**.

As receiver local time is a mapping of the local 1 kHz reference onto a GNSS time-base, it may experience occasional discontinuities, especially when the receiver first starts up and the information it has about the time-base is changing. Indeed after a cold start receiver local time will initially indicate the length of time that the receiver has been running. However, when the receiver obtains some credible timing information from a satellite or aiding message, it will jump to an estimate of GNSS time.

8.2 Navigation Epochs

Each navigation solution is triggered by the tick of the 1 kHz clock nearest to the desired navigation solution time. This tick is referred to as a **navigation epoch**. If the navigation solution attempt is successful, one of the results is an accurate measurement of time in the time-base of the chosen GNSS system, called **GNSS system time**. The difference between the calculated GNSS system time and receiver local time is called the **clock bias** (and the **clock drift** is the rate at which this bias is changing).

In practice the receiver's local oscillator will not be as stable as the atomic clocks to which GNSS systems are referenced and consequently clock bias will tend to accumulate. However, when selecting the next navigation epoch, the receiver will always try to use the 1 kHz clock tick which it estimates to be closest to the desired fix period as measured in GNSS system time. Consequently the number of 1 kHz clock ticks between fixes will occasionally vary (so when producing one fix per second, there will normally be 1000 clock ticks between fixes, but sometimes, to correct drift away from GNSS system time, there will be 999 or 1001).

The GNSS system time calculated in the navigation solution is always converted to a time in both the GPS and UTC time-bases for output.

Clearly when the receiver has chosen to use the GPS time-base for its GNSS system time, conversion to GPS time requires no work at all, but conversion to UTC requires knowledge of the number of leap seconds since GPS time started (and other minor correction terms). The relevant GPS to UTC conversion parameters are transmitted periodically (every 12.5 minutes) by GPS satellites, but can also be supplied to the receiver via the [UBX-MGA-GPS-UTC](#) aiding message. By contrast when the receiver has chosen to use the GLONASS time-base as its GNSS system time, conversion to GPS time is more difficult as it requires knowledge of the difference between the two time-bases, but conversion to UTC is easier (as GLONASS time is closely linked to UTC).

Where insufficient information is available for the receiver to perform any of these time-base conversions precisely, pre-defined default offsets are used. Consequently plausible times are nearly always generated, but they may be wrong by a few seconds (especially shortly after receiver start). Depending on the configuration of the receiver, such "invalid" times may well be output, but with flags indicating their state (e.g. the "valid" flags in [UBX-NAV-PVT](#)).

u-blox receivers employ multiple GNSS system times and/or receiver local times (in order to support multiple GNSS systems concurrently), so users should not rely on UBX messages that report GNSS system time or receiver local time being supported in future. It is therefore recommended to give preference to those messages that report UTC time.

8.3 iTOW Timestamps

All the main UBX-NAV messages (and some other messages) contain an **iTOW** field which indicates the GPS time at which the navigation epoch occurred. Messages with the same iTOW value can be assumed to have come from the same navigation solution.

Note that iTOW values may not be valid (i.e. they may have been generated with insufficient conversion data) and therefore it is not recommended to use the iTOW field for any other purpose.

The original designers of GPS chose to express time/date as an integer week number (starting with the first full week in January 1980) and a time of week (often abbreviated to TOW) expressed in seconds. Manipulating time/date in this form is far easier for digital systems than the more "conventional" year/month/day, hour/minute/second representation. Consequently, most GNSS receivers use this representation internally, only converting to a more "conventional form" at external interfaces. The iTOW field is the most obvious externally visible consequence of this internal representation.

If reliable absolute time information is required, users are recommended to use the [UBX-NAV-PVT](#) or [UBX-HNR-PVT](#) navigation solution messages which also contain additional fields that indicate the validity (and accuracy in [UBX-NAV-PVT](#)) of the calculated times (see also the [GNSS Times](#) section below for further messages containing time information).

8.4 GNSS Times

Each GNSS has its own time reference for which detailed and reliable information is provided in the messages listed in the table below.

GNSS Times

| Time Reference | Message |
|----------------|---------------------------------|
| GPS Time | UBX-NAV-TIMEGPS |
| BeiDou Time | UBX-NAV-TIMEBDS |
| GLONASS Time | UBX-NAV-TIMEGLO |
| Galileo Time | UBX-NAV-TIMEGAL |
| UTC Time | UBX-NAV-TIMEUTC |

8.5 Time Validity

Information about the validity of the time solution is given in the following form:

- **Time validity:** Information about time validity is provided in the `validDate` and `validTime` flags in the [UBX-NAV-PVT](#) message). If these flags are set, the time is known and considered as valid for being used. These flags can be found in the GNSS Times table in the [GNSS Times](#) section above as well as in the [UBX-NAV-PVT](#) and [UBX-HNR-PVT](#) messages.
- **Time validity confirmation:** Information about confirmed validity is provided in the `confirmedDate` and `confirmedTime` flags in the [UBX-NAV-PVT](#) message. If these flags are set, the time validity could be confirmed by using an additional independent source, meaning that the probability of the time to be correct is very high. Note that information about time validity confirmation is only available if the `confirmedAvai` bit in the [UBX-NAV-PVT](#) message is set. Check [UBX-NAV-PVT](#) which Protocol Version supports this flag.

8.6 UTC Representation

UTC time is used in many NMEA and UBX messages. In NMEA messages it is always reported rounded to the nearest hundredth of a second. Consequently, it is normally reported with two decimal places (e.g. 124923.52). What is more, although compatibility mode (selected using [UBX-CFG-NMEA](#)) requires three decimal places, rounding to the nearest hundredth of a second remains, so the extra digit is always 0.

UTC time is also reported within some UBX messages, such as [UBX-NAV-TIMEUTC](#) and [UBX-NAV-PVT](#). In these messages date and time are separated into seven distinct integer fields. Six of these (year, month, day, hour, min and sec) have fairly obvious meanings and are all guaranteed to match the corresponding values in NMEA messages generated by the same navigation epoch. This facilitates simple synchronisation between associated UBX and NMEA messages.

The seventh field is called nano and it contains the number of nanoseconds by which the rest of the time and date fields need to be corrected to get the precise time. So, for example, the UTC time 12:49:23.521 would be reported as: hour: 12, min: 49, sec: 23, nano: 521000000.

It is however important to note that the first six fields are the result of rounding to the nearest hundredth of a second. Consequently the nano value can range from -5000000 (i.e. -5 ms) to +994999999 (i.e. nearly 995 ms).

When the nano field is negative, the number of seconds (and maybe minutes, hours, days, months or even years) will have been rounded up. Therefore, some or all of them will need to be adjusted in order to get the correct time and date. Thus in an extreme example, the UTC time 23:59:59.9993 on 31st December 2011 would be reported as: year: 2012, month: 1, day: 1, hour: 0, min: 0, sec: 0, nano: -700000.

Of course, if a resolution of one hundredth of a second is adequate, negative nano values can simply be rounded up to 0 and effectively ignored.

Which master clock the UTC time is referenced to is output in the message [UBX-NAV-TIMEUTC](#).

For [protocol versions 16 or greater](#), the preferred variant of UTC time can be specified using [UBX-CFG-NAV5](#).

8.7 Leap Seconds

Occasionally it is decided (by one of the international time keeping bodies) that, due to the slightly uneven spin rate of the Earth, UTC has moved sufficiently out of alignment with mean solar time (i.e. the Sun no longer appears directly overhead at 0 longitude at midday). A "leap second" is therefore announced to bring UTC back into close alignment. This normally involves adding an extra second to the last minute of the year, but it can also happen on 30th June. When this happens UTC clocks are expected to go from 23:59:59 to 23:59:60 and only then on to 00:00:00.

It is also theoretically possible to have a negative leap second, in which case there will only be 59 seconds in a minute and 23:59:58 will be followed by 00:00:00.

u-blox receivers are designed to handle leap seconds in their UTC output and consequently users processing UTC times from either NMEA and UBX messages should be prepared to handle minutes that are either 59 or 61 seconds long.

Leap second information can be polled from the u-blox receiver with the message [UBX-NAV-TIMELS](#) for [Protocol Version 18 and above](#).

8.8 Real Time Clock

u-blox receivers contain circuitry to support a **real time clock**, which (if correctly fitted and powered) keeps time while the receiver is otherwise powered off. When the receiver powers up, it attempts to use the real time clock to initialise receiver local time and in most cases this leads to appreciably faster first fixes.

8.9 Date

All GNSS frequently transmit information about the current time within their data message. In most cases, this is a time of week (often abbreviated to TOW), which indicates the elapsed number of seconds since the start of the week (midnight Saturday/Sunday). In order to map this to a full date, it is necessary to know which week and so the GNSS also transmit a week number, typically every 30 seconds. Unfortunately the GPS data message was designed in a way that only allows the bottom 10 bits of the week number to be transmitted. This is not sufficient to yield a completely unambiguous date as every 1024 weeks (a bit less than 20 years), the transmitted week number value "rolls over" back to zero. Consequently, GPS receivers can't tell the difference between, for example, 1980, 1999 or 2019 etc.

Fortunately, although BeiDou and Galileo have similar representations of time, they transmit sufficient bits for the week number to be unambiguous for the foreseeable future (the first ambiguity will be in 2078 for Galileo and not until 2163 for BeiDou). GLONASS has a different structure, based on a time of day, but again transmits sufficient information to avoid any ambiguity during the expected lifetime of the system (the first ambiguous date will be in 2124). Therefore, u-blox 8 / u-blox M8 receivers using [Protocol Version 18 and above](#) regard the date information transmitted by GLONASS, BeiDou and Galileo to be unambiguous and, where necessary, use this to resolve any ambiguity in the GPS date.

Customers attaching u-blox receivers to simulators should be aware that GPS time is referenced to 6th January 1980, GLONASS to 1st January 1996, Galileo to 22nd August 1999 and BeiDou to 1st January 2006; the receiver cannot be expected to work reliably with signals that appear to come from before these dates.

8.9.1 GPS-only Date Resolution

In circumstances where only GPS signals are available and for receivers with earlier firmware versions, the receiver establishes the date by assuming that all week numbers must be at least as large as a reference rollover week number. This reference rollover week number is hard-coded into the firmware at compile time and is normally set a few weeks before the s/w is completed, but it can be overridden by the `wknRollover` field of the [UBX-CFG-NAVX5](#) message to any value the user wishes.

The following example illustrates how this works: Assume that the reference rollover week number set in the firmware at compile time is 1524 (which corresponds to a week in calendar year 2009, but would be transmitted by the satellites as 500). In this case, if the receiver sees transmissions containing week numbers in the range 500 ... 1023, these will be interpreted as week numbers 1524 ... 2047 (CY 2009 ... 2019), whereas transmissions with week numbers from 0 to 499 are interpreted as week numbers 2048 ... 2547 (CY 2019 ... 2028).

It is important to set the reference rollover week number appropriately when supplying u-blox receivers with simulated signals, especially when the scenarios are in the past.

9 Broadcast Navigation Data

Reporting of broadcast navigation data is supported for products using protocol version 17 onwards.

The [UBX-RXM-SFRBX](#) reports the broadcast navigation data message collected by the receiver from each tracked signal. When enabled, a separate message is generated every time the receiver decodes a complete subframe of data from a tracked signal. The data bits are reported, as received, including preambles and error checking bits as appropriate. However because there is considerable variation in the data structure of the different GNSS signals, the form of the reported data also varies. Indeed, although this document uses the term "subframe" generically, it is not strictly the correct term for all GNSS (e.g. GLONASS has "strings" and Galileo

has "pages").

9.1 Parsing Navigation Data Subframes

Each [UBX-RXM-SFRBX](#) message contains a subframe of data bits appropriate for the relevant GNSS, delivered in a number of 32 bit words, as indicated by `numWords` field.

Due to the variation in data structure between different GNSS, the most important step in parsing a [UBX-RXM-SFRBX](#) message is to identify the form of the data. This should be done by reading the `gnssId` field, which indicates which GNSS the data was decoded from. In almost all cases, this is sufficient to indicate the structure and the following sections are organised by GNSS for that reason. However, in some cases the identity of the GNSS is not sufficient, and this is described, where appropriate, in the following sections.

In most cases, the data does not map perfectly into a number of 32 bit words and, consequently, some of the words reported in [UBX-RXM-SFRBX](#) messages contain fields marked as "Pad". These fields should be ignored and no assumption should be made about their contents.

[UBX-RXM-SFRBX](#) messages are only generated when complete subframes are detected by the receiver and all appropriate parity checks have passed.

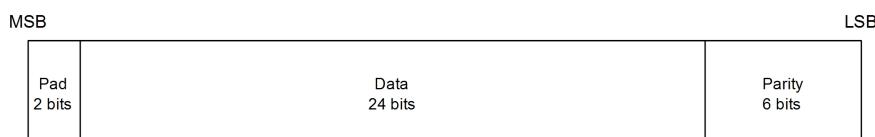

Where the parity checking algorithm requires data to be inverted before it is decoded (e.g. GPS L1C/A), the receiver carries this out before the message output. Therefore, users can process data directly and do not need to worry about repeating any parity processing.

The meaning of the content of each subframe depends on the sending GNSS and is described in the relevant Interface Control Documents (ICD).

9.2 GPS

For GPS (L1C/A) signals, there is a fairly straightforward mapping between the reported subframe and the structure of subframe and words described in the GPS ICD. Each subframe comprises ten data words, which are reported in the same order they are received.

Each word is arranged as follows:

Note that as the GPS data words only comprise 30 bits, the 2 most significant bits in each word reported by [UBX-RXM-SFRBX](#) are padding and should be ignored.

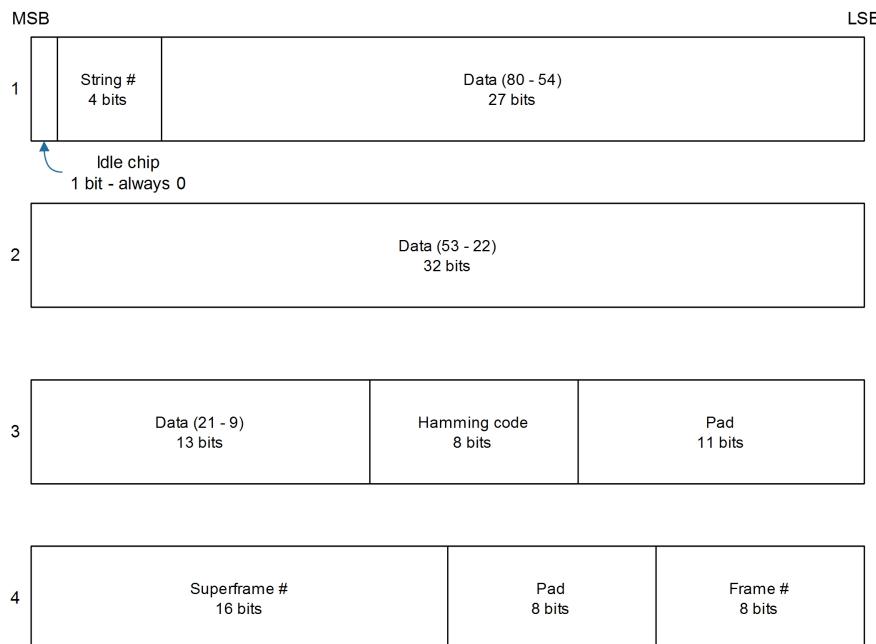

9.3 GLONASS

For GLONASS (L1OF) signals, each reported subframe contains a string as described in the GLONASS ICD. This string comprises 85 data bits which are reported over three 32 bit words in the [UBX-RXM-SFRBX](#) message.

Data bits 1 to 8 are always a hamming code, whilst bits 81 to 84 are a string number and bit 85 is the idle chip, which should always have a value of zero. The meaning of other bits vary with string and frame number.

The fourth and final 32 bit word in the [UBX-RXM-SFRBX](#) message contains frame and superframe numbers (where available). These values aren't actually transmitted by the SVs, but are deduced by the receiver and are included to aid decoding of the transmitted data. However, the receiver does not always know these values, in which case a value of zero is reported.

The four words are arranged as follows:

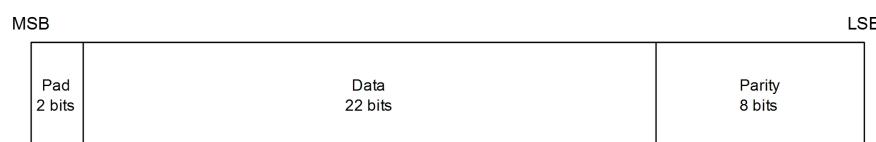

In some circumstances, (especially on startup) the receiver may be able to decode data from a GLONASS SV before it can identify the SV. When this occurs [UBX-RXM-SFRBX](#) messages will be issued with an `svId` of 255 to indicate "unknown".

9.4 BeiDou

For BeiDou (B1I) signals, there is a fairly straightforward mapping between the reported subframe and the structure of subframe and words described in the BeiDou ICD. Each subframe comprises ten data words, which are reported in the same order they are received.

Each word is arranged as follows:

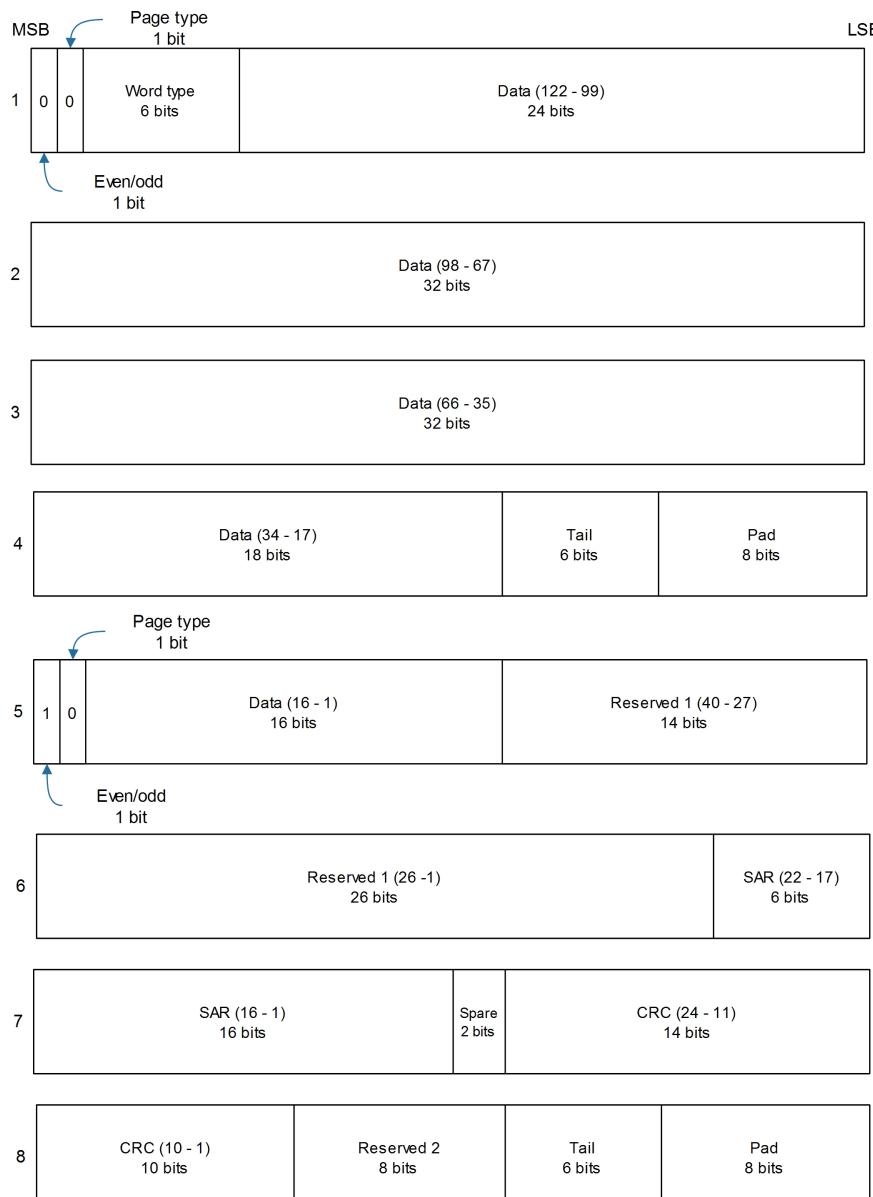

Note that as the BeiDou data words only comprise 30 bits, the 2 most significant bits in each word reported by [UBX-RXM-SFRBX](#) are padding and should be ignored.

9.5 Galileo

For Galileo (E1OS) signals, each reported subframe contains a pair of I/NAV pages as described in the Galileo ICD.

Galileo pages can either be "Nominal" or "Alert" pages. For Nominal pages the eight words are arranged as follows:

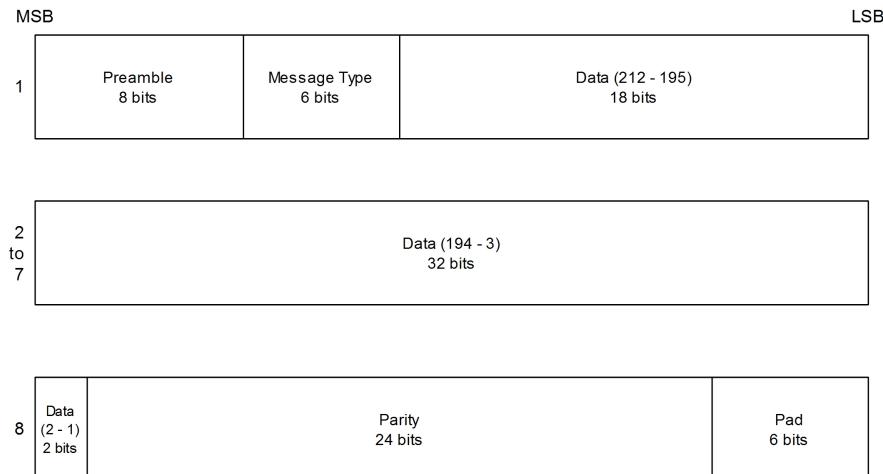

Alert pages are reported in very similar manner, but the page type bits will have value 1 and the structure of the eight words will be slightly different (as indicated by the Galileo ICD).

9.6 SBAS

For SBAS (L1C/A) signals each reported subframe contains eight 32 data words to deliver the 250 bits transmitted in each SBAS data block.

The eight words are arranged as follows:

9.7 QZSS

The structure of the data delivered by QZSS (L1C/A) signals is effectively identical to that for [GPS \(L1C/A\)](#).

The QZSS (L1SAIF) signal is different and uses the same data block format as used by [SBAS \(L1C/A\)](#). QZSS (SAIF) signals can be distinguished from QZSS (L1C/A) by noting that they have 8 words, instead of 10 for QZSS (L1C/A).

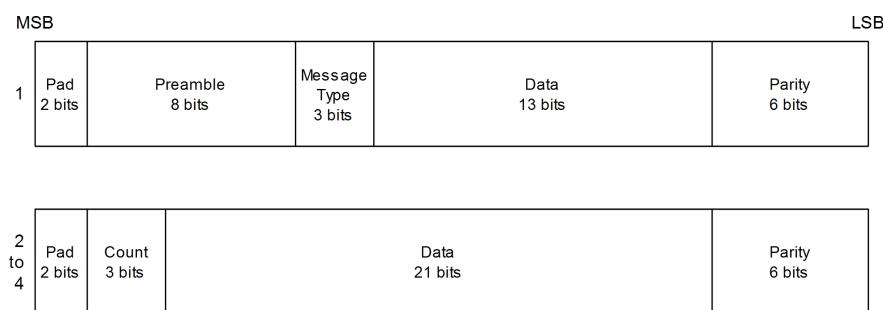

9.8 IMES

Data messages from IMES are of variable length and u-blox receivers currently support the following varieties:

- Short - comprising of a single word
- Medium - comprising of two words
- Position 1 - comprising of three words
- Position 2 - comprising of four words

As a consequence, an IMES [UBX-RXM-SFRBX](#) message may have a numWords value of 1, 2, 3 or 4.

In all cases the structure of words follows the same pattern, with the first word being different from any/all subsequent words as indicated by the following diagram:

9.9 Summary

The following table gives a summary of the different data message formats reported by the [UBX-RXM-SFRBX](#) message.

Data message formats reported by UBX-RXM-SFRBX

| <i>GNSS</i> | <i>Signal</i> | <i>gnssId</i> | <i>numWords</i> | <i>period</i> |
|-------------|---------------|---------------|-----------------|---------------|
| GPS | L1C/A | 0 | 10 | 6s |
| SBAS | L1C/A | 1 | 8 | 1s |
| Galileo | E1OS | 2 | 8 | 2s |
| BeiDou | B1I D1 | 3 | 10 | 6s |
| BeiDou | B1I D2 | 3 | 10 | 0.6s |
| IMES | Short | 4 | 1 | - |
| IMES | Medium | 4 | 2 | - |
| IMES | Position 1 | 4 | 3 | - |
| IMES | Position 2 | 4 | 4 | - |
| QZSS | L1C/A | 5 | 10 | 6s |
| QZSS | L1SAIF | 5 | 8 | 1s |
| GLONASS | L1OF | 6 | 4 | 2s |

10 Serial Communication Ports Description

u-blox receivers come with a highly flexible communication interface. It supports the NMEA and the proprietary UBX protocols, and is truly multi-port and multi-protocol capable. Each protocol (UBX, NMEA) can be assigned to several ports at the same time (multi-port capability) with individual settings (e.g. baud rate, message rates, etc.) for each port. It is even possible to assign more than one protocol (e.g. UBX protocol and NMEA at the same time) to a single port (multi-protocol capability), which is particularly useful for debugging purposes.

To enable a message on a port the UBX and/or NMEA protocol must be enabled on that port using the UBX proprietary message [CFG-PRT](#). This message also allows changing port-specific settings (baud rate, address etc.). See [CFG-MSG](#) for a description of the mechanism for enabling and disabling messages.

The following table shows the port numbers used. Note that any numbers not listed are reserved for future use.

Port Number assignment

| <i>Port #</i> | <i>Electrical Interface</i> |
|---------------|-----------------------------------|
| 0 | DDC (I ² C compatible) |
| 1 | UART 1 |
| 3 | USB |
| 4 | SPI |

10.1 TX-ready indication

This feature enables each port to define a corresponding pin, which indicates if bytes are ready to be transmitted. By default, this feature is disabled. For USB, this feature is configurable but might not behave as described below due to a different internal transmission mechanism. If the number of pending bytes reaches the threshold configured for this port, the corresponding pin will become active (configurable active-low or active-high), and stay active until the last bytes have been transferred from software to hardware (note that this is not necessarily equal to all bytes transmitted, i.e. after the pin has become inactive, up to 16 bytes can still need to be transferred to the host).

The TX-ready pin can be selected from all PIOs which are not in use (see [MON-HW](#) for a list of the PIOs and their mapping), each TX-ready pin is exclusively for one port and cannot be shared. If the PIO is invalid or already in use, only the configuration for the TX-ready pin is ignored, the rest of the port configuration is applied if valid. The acknowledge message does not indicate if the TX-ready configuration is successfully set, it only indicates the successful configuration of the port. To validate successful configuration of the TX-ready pin, the port

configuration should be polled and the settings of TX-ready feature verified (will be set to disabled/all zero if settings invalid).

The threshold should not be set above 2 kB, as the internal message buffer limit can be reached before this, resulting in the TX-ready pin never being set as messages are discarded before the threshold is reached.

10.2 Extended TX timeout

If the host does not communicate over SPI or DDC for more than approximately 2 seconds, the device assumes that the host is no longer using this interface and no more packets are scheduled for this port. This mechanism can be changed enabling "extended TX timeouts", in which case the receiver delays idling the port until the allocated and undelivered bytes for this port reach 4 kB. This feature is especially useful when using the TX-ready feature with a message output rate of less than once per second, and polling data only when data is available, determined by the TX-ready pin becoming active.

10.3 UART Ports

One or two Universal Asynchronous Receiver/Transmitter ([UART](#)) ports are featured, that can be used to transmit GNSS measurements, monitor status information and configure the receiver. See our online product descriptions for availability.

The serial ports consist of an RX and a TX line. Neither handshaking signals nor hardware flow control signals are available. These serial ports operate in asynchronous mode. The baud rates can be configured individually for each serial port. However, there is no support for setting different baud rates for reception and transmission.

Possible UART Interface Configurations

| Baud Rate | Data Bits | Parity | Stop Bits |
|-----------|-----------|--------|-----------|
| 4800 | 8 | none | 1 |
| 9600 | 8 | none | 1 |
| 19200 | 8 | none | 1 |
| 38400 | 8 | none | 1 |
| 57600 | 8 | none | 1 |
| 115200 | 8 | none | 1 |
| 230400 | 8 | none | 1 |
| 460800 | 8 | none | 1 |

Note that for protocols such as NMEA or UBX, it does not make sense to change the default word length values (data bits) since these properties are defined by the protocol and not by the electrical interface.

If the amount of data configured is too much for a certain port's bandwidth (e.g. all UBX messages output on a UART port with a baud rate of 9600), the buffer will fill up. Once the buffer space is exceeded, new messages to be sent will be dropped. To prevent message losses, the baud rate and communication speed or the number of enabled messages should be selected so that the expected number of bytes can be transmitted in less than one second.

See [CFG-PRT for UART](#) for a description of the contents of the UART port configuration message.

10.4 USB Port

One Universal Serial Bus ([USB](#)) port is featured. See the Data Sheet of your specific product for availability. This port can be used for communication purposes and to power the positioning chip or module.

The USB interface supports two different power modes:

- In *Self Powered Mode* the receiver is powered by its own power supply. **VDDUSB** is used to detect the availability of the USB port, i.e. whether the receiver is connected to a USB host.
- In *Bus Powered Mode* the device is powered by the USB bus, therefore no additional power supply is needed. See the table below for the default maximum current that can be drawn by the receiver. See [CFG-USB](#) for a description on how to change this maximum. Configuring Bus Powered Mode indicates that the device will enter a low power state with disabled GNSS functionality when the host suspends the device, e.g. when the host is put into stand-by mode.

Maximum Current in Bus Powered Mode

| Generation | Max Current |
|----------------------|-------------|
| u-blox 8 / u-blox M8 | 100 mA |

 The voltage range for **VDDUSB** is specified from 3.0V to 3.6V, which differs slightly from the specification for VCC

 The boot screen is retransmitted on the USB port after the enumeration. However, messages generated between bootup of the receiver and USB enumeration are not visible on the USB port.

10.5 DDC Port

The Display Data Channel ([DDC](#)) bus is a two-wire communication interface compatible with the I²C standard ([I²C](#)). See our online product selector matrix for availability.

Unlike all other interfaces, the DDC is not able to communicate in full-duplex mode, i.e. TX and RX are mutually exclusive. u-blox receivers act as a slave in the communication setup, therefore they cannot initiate data transfers on their own. The host, which is always master, provides the data clock (SCL), and the clock frequency is therefore not configurable on the slave.

The receiver's DDC address is set to 0x42 by default. This address can be changed by setting the mode field in [CFG-PRT](#) for [DDC](#) accordingly.

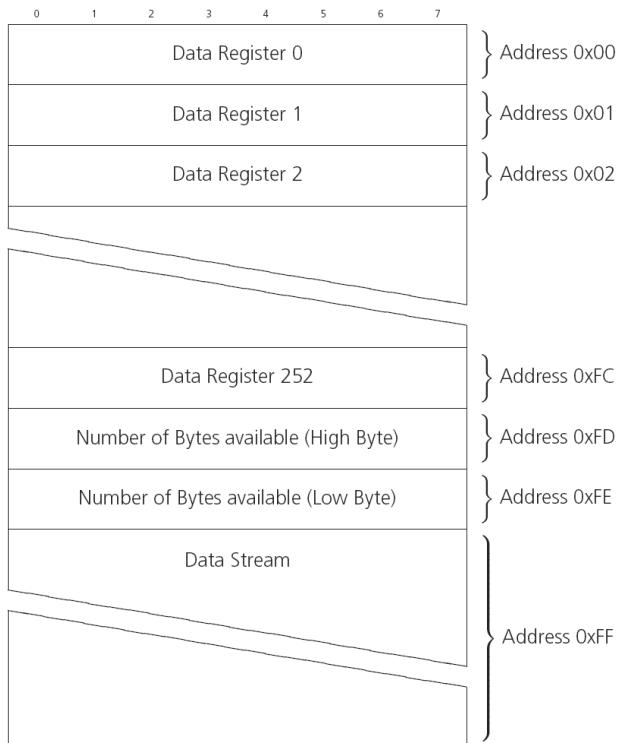

As the receiver will be run in slave mode and the DDC physical layer lacks a handshake mechanism to inform the master about data availability, a layer has been inserted between the physical layer and the UBX and NMEA layer. The receiver DDC interface implements a simple streaming interface that allows the constant polling of data, discarding everything that is not parseable. The receiver returns 0xFF if no data is available. The [TX-ready](#) feature can be used to inform the master about data availability and can be used as a trigger for data transmission.

10.5.1 Read Access

The DDC interface allows 256 slave registers to be addressed. As shown in Figure *DDC Register Layout* only three of these are currently implemented. The data registers 0 to 252, at addresses 0x00 to 0xFC, each 1 byte in size, contain information to be defined later - the result of reading them is undefined. The currently available number of bytes in the message stream can be read at addresses 0xFD and 0xFE. The register at address 0xFF allows the data stream to be read. If there is no data awaiting transmission from the receiver, then this register will deliver the value 0xff, which cannot be the first byte of a valid message. If message data is ready for transmission then successive reads of register 0xff will deliver the waiting message data.

 The registers 0x00 to 0xFC are reserved for future use and may be defined in a later firmware release. Do not use them, as they don't provide any meaningful data!

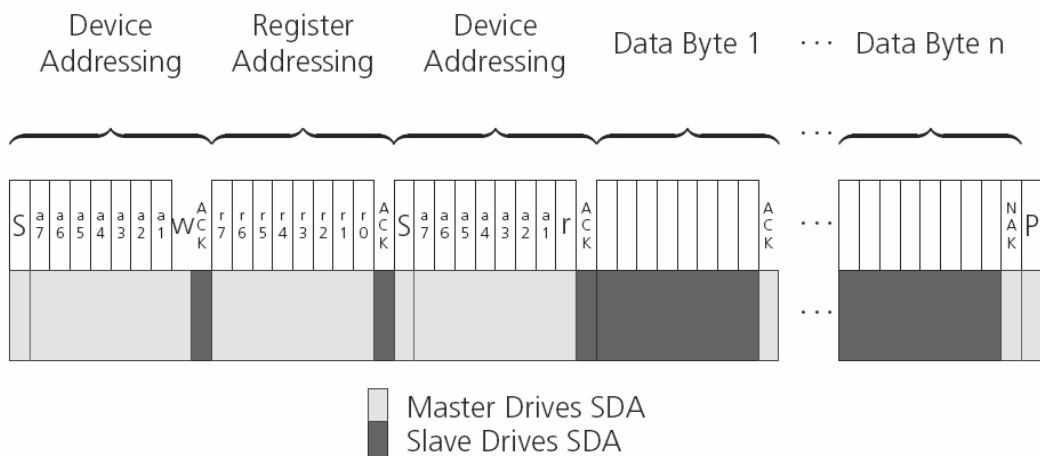

DDC Register Layout

10.5.1.1 Read Access Forms

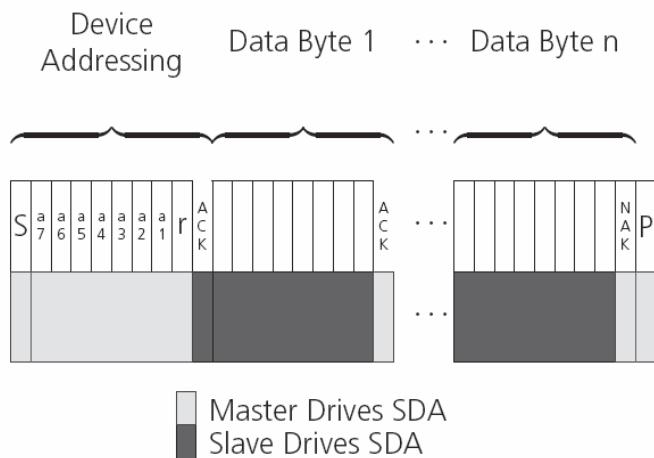

There are two forms of DDC read transfer. The 'random access' form includes a slave register address and thus allows any register to be read. The second 'current address' form omits the register address. If this second form is used then an address pointer in the receiver is used to determine which register to read. This address pointer will increment after each read unless it is already pointing at register 0xff, the highest addressable register, in which case it remains unaltered. The initial value of this address pointer at startup is 0xff, so by default all current address reads will repeatedly read register 0xff and receive the next byte of message data (or 0xff if no message data is waiting). Figure *DDC Random Read Access* shows the format of the random access form of the request. Following the start condition from the master, the 7-bit device address and the **RW** bit (which is a logic low for write access) are clocked onto the bus by the master transmitter. The receiver answers with an acknowledge (logic low) to indicate that it recognises the address. Next, the 8-bit address of the register to be read must be written to the bus. Following the receiver's acknowledge, the master again triggers a start condition and writes the device address, but this time the **RW** bit is a logic high to initiate the read access. Now, the master can read 1 to N bytes from the receiver, generating a not-acknowledge and a stop condition after the last byte being read.

DDC Random Read Access

The format of the current address read request is :

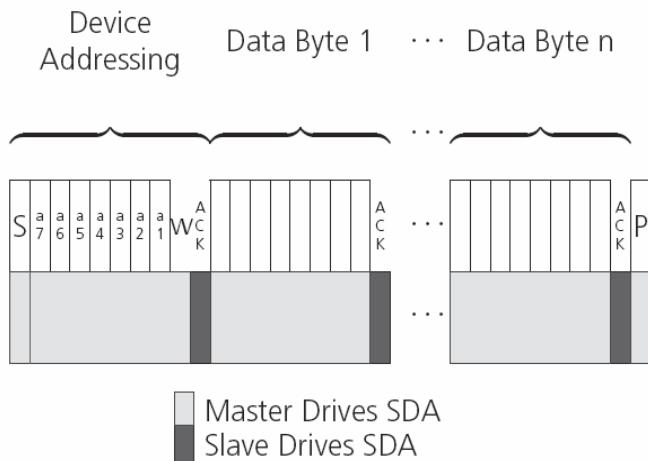

DDC Current Address Read Access

10.5.2 Write Access

The receiver does not provide any write access except for writing UBX and NMEA messages to the receiver, such as configuration or aiding data. Therefore, the register set mentioned in section [Read Access](#) is not writeable. Following the start condition from the master, the 7-bit device address and the RW bit (which is a logic low for write access) are clocked onto the bus by the master transmitter. The receiver answers with an acknowledge (logic low) to indicate that it is responsible for the given address. Now, the master can write 2 to n bytes to the receiver, generating a stop condition after the last byte being written. The number of data bytes must be at least 2 to properly distinguish from the write access to set the address counter in random read accesses.

DDC Write Access

10.6 SPI Port

A Serial Peripheral Interface ([SPI](#)) bus is available with selected receivers. See our online product descriptions for availability.

SPI is a four-wire synchronous communication interface. In contrast to UART, the master provides the clock signal, which therefore doesn't need to be specified for the slave in advance. Moreover, a baud rate setting is not applicable for the slave. SPI modes 0-3 are implemented and can be configured using the field mode .spiMode in [CFG-PRT for SPI](#) (default is SPI mode 0).

The SPI clock speed is limited depending on hardware and firmware versions!

10.6.1 Maximum SPI clock speed

u-blox 8 / u-blox M8 receivers support a maximum SPI clock speed of 5.5 MHz.

10.6.2 Read Access

As the register mode is not implemented for the SPI port, only the UBX/NMEA message stream is provided. This stream is accessed using the Back-To-Back Read and Write Access (see section [Back-To-Back Read and Write Access](#)). When no data is available to be written to the receiver, MOSI should be held logic high, i.e. all bytes written to the receiver are set to 0xFF.

To prevent the receiver from being busy parsing incoming data, the parsing process is stopped after 50 subsequent bytes containing 0xFF. The parsing process is re-enabled with the first byte not equal to 0xFF. The number of bytes to wait for deactivation (50 by default) can be adjusted using the field mode .ffCnt in [CFG-PRT for SPI](#), which is only necessary when messages shall be sent containing a large number of subsequent 0xFF bytes.

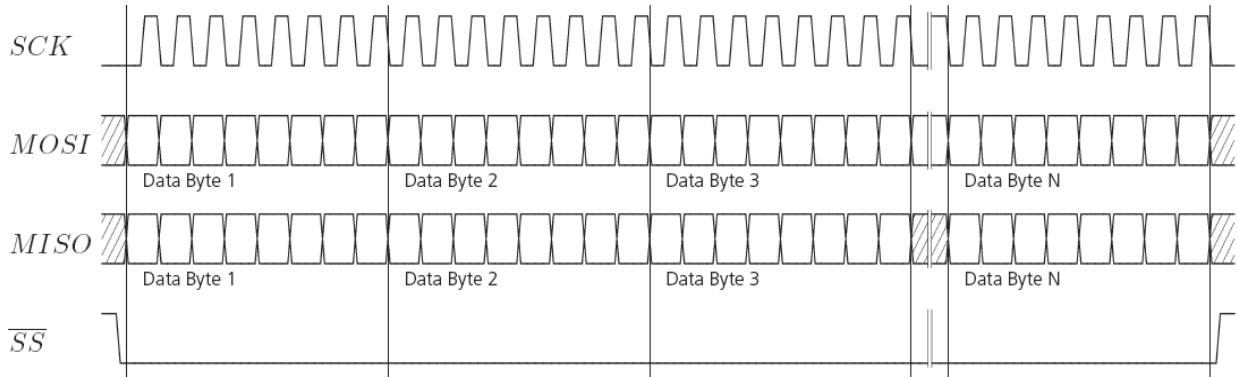

If the receiver has no more data to send, it sets MISO to logic high, i.e. all bytes transmitted decode to 0xFF. An efficient parser in the host will ignore all 0xFF bytes which are not part of a message and will resume data processing as soon as the first byte not equal to 0xFF is received.

10.6.3 Back-To-Back Read and Write Access

The receiver does not provide any write access except for writing UBX and NMEA messages to the receiver, such as configuration or aiding data. For every byte written to the receiver, a byte will simultaneously be read from the receiver. While the master writes to MOSI, at the same time it needs to read from MISO, as any

pending data will be output by the receiver with this access. The data on MISO represents the results from a current address read, returning 0xFF when no more data is available.

SPI Back-To-Back Read/Write Access

10.7 How to change between protocols

Reconfiguring a port from one protocol to another is a two-step process:

- Step 1: the preferred protocol(s) needs to be enabled on a port using [CFG-PRT](#). One port can handle several protocols at the same time (e.g. NMEA and UBX). By default, all ports are configured for UBX and NMEA protocol so in most cases, it's not necessary to change the port settings at all. Port settings can be viewed and changed using the [CFG-PRT](#) messages.
- Step 2: activate certain messages on each port using [CFG-MSG](#).

11 Multiple GNSS Assistance (MGA)

11.1 Introduction

Users would ideally like GNSS receivers to provide accurate position information the moment they are turned on. With standard GNSS receivers there can be a significant delay in providing the first position fix, principally because the receiver needs to obtain data from several satellites and the satellites transmit that data slowly. Under adverse signal conditions, data downloads from the satellites to the receiver can take minutes, hours or even fail altogether.

Assisted GNSS (A-GNSS) is a common solution to this problem and involves some form of reference network of receivers that collect data such as ephemeris, almanac, accurate time and satellite status and pass this onto to the target receiver via any suitable communications link. Such assistance data enables the receiver to compute a position within a few seconds, even under poor signal conditions.

The UBX-MGA message class provides the means for delivering assistance data to u-blox receivers and customers can obtain it from the u-blox AssistNow Online or AssistNow Offline Services. Alternatively they can obtain assistance data from third-party sources (e.g. SUPL/RRLP) and generate the appropriate UBX-MGA messages to send this data to the receiver.

11.2 Assistance Data

u-blox receivers currently accept the following types of assistance data:

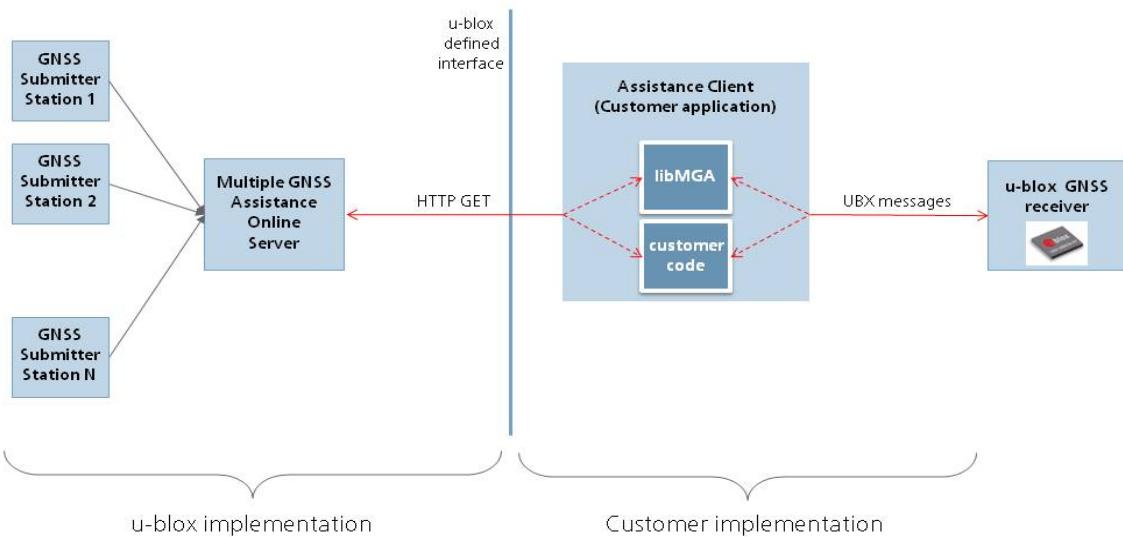

- **Position:** Estimated receiver position can be submitted to the receiver using the [UBX-MGA-INI-POS_XYZ](#) or [UBX-MGA-INI-POS_LLH](#) messages.

- **Time:** The current time can either be supplied as an inexact value via the standard communication interfaces, suffering from latency depending on the baud rate, or using hardware time synchronization where an accurate time pulse is connected to an external interrupt. The preferred option is to supply UTC time using the [UBX-MGA-INI-TIME_UTC](#) message, but times referenced to some GNSS can be delivered with the [UBX-MGA-INI-TIME_GNSS](#) message.
- **Clock drift:** An estimate of the clock drift can be sent to the receiver using the [UBX-MGA-INI-CLKD](#) message.
- **Frequency:** It is possible to supply hardware frequency aiding by connecting a periodic rectangular signal with a frequency up to 500 kHz and arbitrary duty cycle (low/high phase duration must not be shorter than 50 ns) to an external interrupt, and providing the applied frequency value using the [UBX-MGA-INI-FREQ](#) message.
- **Current orbit data:** Each different GNSS transmits orbit data in slightly different forms. For each system there are separate messages for delivering ephemeris and almanac. So for example GPS ephemeris is delivered to the receiver using the [UBX-MGA-GPS-FPH](#) message, while GLONASS almanac is delivered with the [UBX-MGA-GLO-ALM](#) message.
- **Predicted orbit data:** [UBX-MGA-ANO](#) messages can be used to supply predictions of future orbit information to a u-blox receiver. These messages can be obtained from the AssistNow Offline Service and allow a receiver to improve its TTFF even when it is no longer connected to the Internet.
- **Auxiliary information:** Each GNSS transmits some auxiliary data (such as SV health information or UTC parameters) to the receiver. A selection of messages exist for providing such information to the receiver, such as [UBX-MGA-GPS-IONO](#) for ionospheric data from GPS.
- **EOP:** Earth Orientation Parameters can be sent to the receiver using the [UBX-MGA-INI-EOP](#) message. This will replace the default model used by the AssistNow Autonomous feature and may improve performance (particularly as the receiver gets older and the built-in model decays).
- **Navigation Database:** u-blox receivers can be instructed to dump the current state of their internal navigation database with the [UBX-MGA-DBD-POLL](#) message; sending this information back to the receiver (e.g. after a period when the receiver was turned off) restores the database to its former state, and thus allows the receiver to restart rapidly.

11.3 AssistNow Online

AssistNow Online is u-blox' end-to-end Assisted GNSS (A-GNSS) solution for receivers that have access to the Internet. Data supplied by the AssistNow Online Service can be directly uploaded to a u-blox receiver in order to substantially reduce Time To First Fix (TTFF), even under poor signal conditions. The system works by collecting data such as ephemeris and almanac from the satellites through u-blox' Global Reference Network of receivers and providing this data to customers in a convenient form that can be forwarded on directly to u-blox receivers. The AssistNow Online Service uses a simple, stateless, HTTP interface. Therefore, it works on all standard mobile communication networks that support Internet access, including GPRS, UMTS and Wireless LAN. No special arrangements need to be made with mobile network operators to enable AssistNow Online.

Multiple GNSS Assistance Architecture

The data returned by the AssistNow Online Service is a sequence of UBX-MGA messages, starting with an estimate of the current time in the form of a [UBX-MGA-INI-TIME_UTC](#) message.

AssistNow Online currently supports GPS, GLONASS, BeiDou, Galileo, and QZSS.

Customers may choose to use third party sources of assistance data instead of using the AssistNow Online Service. Customers choosing this option will need to ensure that the data is converted from the format used by the third party source to the appropriate MGA messages. However, it is important to ensure that the receiver has an estimate of the current time before it processes any other assistance data. For this reason, it is strongly recommended to send a [UBX-MGA-INI-TIME_UTC](#) or [UBX-MGA-INI-TIME_GNSS](#) as the first message of any assistance.

11.3.1 Host Software

As u-blox receivers have no means to connect directly with the Internet, the AssistNow Online system can only work if the host system that contains the receiver can connect to the Internet, download the data from the AssistNow Online Service and forward it on to the receiver. In the simplest case that may involve fetching the data from the AssistNow Online Service (by means of a single HTTP GET request), and sending the resulting data to the receiver.

Depending on the circumstances, it may be beneficial for the host software to include:

- Creating an appropriate [UBX-MGA-INI-TIME_UTC](#) message to deliver a better sense of time to the receiver, especially if the host system has a very good sense of the current time and can deliver a time pulse to one of the receiver's EXTINT pins.
- Enable and use [flow control](#) to prevent loss of data due to buffer overflow in the receiver.

u-blox provides the source code for an example library, called *libMGA*, that provides all of the functionality we expect in most host software.

11.3.2 AssistNow Online Sequence

A typical sequence of use of the AssistNow Online Service comprises the following steps:

- Power-up the u-blox receiver
- Request data from the AssistNow Online Service
- Optionally send [UBX-MGA-INI-TIME_UTC](#) followed by hardware time synchronization pulse if hardware time synchronization is required.
- Send the UBX messages obtained from the AssistNow Online Service to the receiver.

11.3.3 Flow Control

u-blox receivers aim to process incoming messages as quickly as possible, but there will always be a small delay in processing each message. Uploading assistance data to the receiver can involve sending as many as one hundred of individual messages to the receiver, one after the other. If the communication link is fast, and/or the receiver is busy (trying to acquire new signals), it is possible that the internal buffers will overflow and some messages will be lost. In order to combat this, u-blox receivers support an optional flow control mechanism for assistance.

Flow control is activated by setting the ackAiding parameter in the [UBX-CFG-NAVX5](#) message. As a result the receiver will issue an acknowledgement message ([UBX-MGA-ACK](#)) for each assistance message it successfully receives. The host software can examine these acknowledgements to establish whether there were any problems with the data sent to the receiver and deduce (by the lack of acknowledgement) if any messages have been lost. It may then be appropriate to resend some of the assistance messages.

The simplest way to implement flow control would be to send one UBX-MGA assistance message at a time, waiting for the acknowledgement, before sending the next. However, such a strategy is likely to introduce significant delays into the whole assistance process. The best strategy will depend on the amount of assistance data being sent and the nature of the communications link (e.g. baud rate of serial link). u-blox recommends that when customers are developing their host software they start by sending all assistance messages and then analyse the resulting acknowledgements to see whether there have been significant losses. Adding small delays during the transmission may be a simple but effective way to avoid substantial loss of data.

11.3.4 Authorization

The AssistNow Online Service is only available for use by u-blox customers. In order to use the services, customers will need to obtain an authorization token from u-blox. This token must be supplied as a parameter whenever a request is made to either service.

11.3.5 Service Parameters

The information exchange with the AssistNow Online Service is based on the HTTP protocol. Upon reception of an HTTP GET request, the server will respond with the required messages in binary format or with an error string in text format. After delivery of all data, the server will terminate the connection.

The HTTP GET request from the client to the server should contain a standard HTTP query string in the request URL. The query string consists of a set of "key=value" parameters in the following form:

key=value;key=value;key=value;

The following rules apply:

- The order of keys is not important.
- Keys and values are case sensitive.
- Keys and values must be separated by an equals character ('=').

- Key/value pairs must be separated by semicolons (';').
- If a value contains a list, each item in the list must be separated by a comma (',').

The following table describes the keys that are supported.

AssistNow Online Parameter Keys

| Key Name | Unit/Range | Optional | Description |
|-------------|---------------------|-----------|--|
| token | String | Mandatory | The authorization token supplied by u-blox when a client registers to use the service. |
| gnss | String | Mandatory | A comma separated list of the GNSS for which data should be returned. Valid GNSS are: gps, qzss and glo. |
| datatype | String | Mandatory | A comma separated list of the data types required by the client. Valid data types are: eph, alm, aux and pos. Time data is always returned for each request. If the value of this parameter is an empty string, only time data will be returned. |
| lat | Numeric [degrees] | Optional | Approximate user latitude in WGS 84 expressed in degrees and fractional degrees. Must be in range -90 to 90. Example: lat=47.2. |
| lon | Numeric [degrees] | Optional | Approximate user longitude in WGS 84 expressed in degrees and fractional degrees. Must be in range -180 to 180. Example: lon=8.55. |
| alt | Numeric [meters] | Optional | Approximate user altitude above WGS 84 Ellipsoid. If this value is not provided, the server assumes an altitude of 0 meters. Must be in range -1000 to 50000. |
| pacc | Numeric [meters] | Optional | Approximate accuracy of submitted position (see position parameters note below). If this value is not provided, the server assumes an accuracy of 300km. Must be in range 0 to 6000000. |
| tacc | Numeric [seconds] | Optional | The timing accuracy (see time parameters note below). If this value is not provided, the server assumes an accuracy of 10 seconds. Must be in range 0 to 3600. |
| latency | Numeric [seconds] | Optional | Typical latency between the time the server receives the request, and the time when the assistance data arrives at the u-blox receiver. The server can use this value to correct the time being transmitted to the client. If this value is not provided, the server assumes a latency of 0. Must be in range 0 to 3600. |
| filteronpos | (no value required) | Optional | If present, the ephemeris data returned to the client will only contain data for the satellites which are likely to be visible from the approximate position provided by the lat, lon, alt and pacc parameters. If the lat and lon parameters are not provided the service will return an error. |
| filteronsv | String | Optional | A comma separated list of u-blox gnssId:svId pairs. The ephemeris data returned to the client will only contain data for the listed satellites. |

Thus, as an example, a valid parameter string would be:

token=XXXXXXXXXXXXXXXXXXXXXX;gnss=gps,qzss;datatype=eph,pos,aux;lat=47.28;lon=8.56;pacc=1000

11.3.5.1 Position parameters (lat, lon, alt and pacc)

The position parameters (lat, lon, alt and pacc) are used by the server for two purposes:

- If the filteronpos parameter is provided, the server determines the currently visible satellites at the user position, and only sends the ephemeris data of those satellites which should be in view at the location of the

user. This reduces bandwidth requirements. In this case the 'pacc' value is taken into account, meaning that the server will return all SVs visible in the given uncertainty region.

- If the datatype 'pos' is requested, the server will return the position and accuracy in the response data. When this data is supplied to the u-blox receiver, depending on the accuracy of the provided data, the receiver can then choose to select a better startup strategy. For example, if the position is accurate to 100km or better, the u-blox receiver will choose to go for a more optimistic startup strategy. This will result in quicker startup time. The receiver will decide which strategy to choose, depending on the 'pacc' parameter. If the submitted user position is less accurate than what is being specified with the 'pacc' parameter, then the user will experience prolonged or even failed startups.

11.3.5.2 Time parameters (tacc and latency)

Time data is always returned with each request. The time data refers to the time at which the response leaves the server, corrected by an optional latency value. This time data provided by the service is accurate to approximately 10ms but by default the time accuracy is indicated to be +/-10 seconds in order to account for network latency and any time between the client receiving the data and it being provided to the receiver.

If both the network latency and the client latency can safely be assumed to be very low (or are known), the client can choose to set the accuracy of the time message (tacc) to a much smaller value (e.g. 0.5s). This will result in a faster TTFF. The latency can also be adjusted as appropriate. However, these fields should be used with caution: if the time accuracy is not correct when the time data reaches the receiver, the receiver may experience prolonged or even failed start-ups.

For optimal results, the client should establish an accurate sense of time itself (e.g. by calibrating its system clock using a local NTP service) and then modify the time data received from the service as appropriate.

11.3.6 Multiple Servers

u-blox has designed and implemented the AssistNow Online Service in a way that should provide very high reliability. Nonetheless, there will be rare occasions when a server is not available (e.g. due to failure or some form of maintenance activity). In order to protect customers against the impact of such outages, u-blox will run at least two instances of the AssistNow Online Service on independent machines. Customers will have a free choice of requesting assistance data from any of these servers, as all will provide the same information. However, should one fail for whatever reason, it is highly unlikely that the other server(s) will also be unavailable. Therefore customers requiring the best possible availability are recommended to implement a scheme where they direct their requests to a chosen server, but, if that server fails to respond, have a fall-back mechanism to use another server instead.

11.4 AssistNow Offline

AssistNow Offline is a feature that combines special firmware in u-blox receivers and a proprietary service run by u-blox. It is targeted at receivers that only have occasional Internet access and so can't use AssistNow Online. AssistNow Offline speeds up Time To First Fix (TTFF), typically to considerably less than 10s

AssistNow Offline currently supports GPS and GLONASS. u-blox intend to expand the AssistNow Offline Service to support other GNSS (such as BeiDou and Galileo) in due course.

The AssistNow Offline Service uses a simple, stateless, HTTP interface. Therefore, it works on all standard mobile communication networks that support Internet access, including GPRS, UMTS and Wireless LAN. No special arrangements need to be made with mobile network operators to enable AssistNow Offline.

Users of AssistNow Offline are expected to download data from the AssistNow Offline Service, specifying the time period they want covered (1 to 5 weeks) and the types of GNSS. This data must be uploaded to a u-blox receiver, so that it can estimate the positions of the satellites, when no better data is available. Using these

estimates will not provide as accurate a position fix as if current ephemeris data is used, but it will allow much faster TTFFs in nearly all cases.

The data obtained from the AssistNow Offline Service is organised by date, normally a day at a time.

Consequently the more weeks for which coverage is requested, the larger the amount of data to handle.

Similarly, each different GNSS requires its own data and in the extreme cases, several hundred kilobytes of data will be provided by the service. This amount can be reduced by requesting lower resolution, but this will have a small negative impact on both position accuracy and TTFF. See the section on [Offline Service Parameters](#) for details of how to specify these options.

The downloaded Offline data is encoded in a sequence of [UBX-MGA-ANO](#) messages, one for every SV for every day of the period covered. Thus, for example, data for all GPS SVs for 4 weeks will involve in excess of 900 separate messages, taking up around 70kbytes. Where a u-blox receiver has flash storage, all the data can be directly uploaded to be stored in the flash until it is needed. In this case, the receiver will automatically select the most appropriate data to use at any time. See the section on [flash-based AssistNow Offline](#) for further details.

AssistNow Offline can also be used where the receiver has no flash storage, or there is insufficient spare flash memory. In this case the customer's system must store the AssistNow Offline data until the receiver needs it and then upload only the appropriate part for immediate use. See the section on [host-based AssistNow Offline](#) for further details.

11.4.1 Service Parameters

The information exchange with the AssistNow Offline Service is based on the HTTP protocol. Upon reception of an HTTP GET request, the server will respond with the required messages in binary format or with an error string in text format. After delivery of all data, the server will terminate the connection.

The HTTP GET request from the client to the server should contain a standard HTTP querystring in the request URL. The querystring consists of a set of "key=value" parameters in the following form:

key=value;key=value;key=value;

The following rules apply:

- The order of keys is not important.
- Keys and values are case sensitive.
- Keys and values must be separated by an equals character ('=').
- Key/value pairs must be separated by semicolons (';').
- If a value contains a list, each item in the list must be separated by a comma (',').

The following table describes the keys that are supported.

AssistNow Offline Parameter Keys

| Key Name | Unit/Range | Optional | Description |
|----------|-----------------|-----------|--|
| token | String | Mandatory | The authorization token supplied by u-blox when a client registers to use the service. |
| gnss | String | Mandatory | A comma separated list of the GNSS for which data should be returned. The currently supported GNSS are: gps and glo. |
| period | Numeric [weeks] | Optional | The number of weeks into the future the data should be valid for. Data can be requested for up to 5 weeks in to the future. If this value is not provided, the server assumes a period of 4 weeks. |

AssistNow Offline Parameter Keys continued

| Key Name | Unit/Range | Optional | Description |
|------------|----------------|----------|---|
| resolution | Numeric [days] | Optional | The resolution of the data: 1=every day, 2=every other day, 3=every third day. If this value is not provided, the server assumes a resolution of 1 day. |

Thus, as an example, a valid parameter string would be:

token=XXXXXXXXXXXXXXXXXXXXXX;gnss=gps,glo;

11.4.2 Authorization

The AssistNow Offline Service uses the same authorization process as AssistNow Online; see [above](#) for details.

11.4.3 Multiple Servers

The AssistNow Offline Service uses the same multiple server mechanism to provide high availability as AssistNow Online; see [above](#) for details.

11.4.4 Time, Position and Almanac

While AssistNow Offline can be used on its own, it is expected that the user will provide estimates of the receiver's current position, the current time and ensure that a reasonably up to date almanac is available. In most cases this information is likely to be available without the user needing to do anything. For example, where the receiver is connected to a battery backup power supply and has a functioning real time clock (RTC), the receiver will keep its own sense of time and will retain the last known position and any almanac. However, should the receiver be completely unpowered before startup, then it will greatly improve TTFF if time, position and almanac can be supplied in some form.

Almanac data has a validity period of several weeks, so can be downloaded from the AssistNow Online service at roughly the same time the Offline data is obtained. It can then be stored in the host for uploading on receiver startup, or it can be transferred to the receiver straight away and preserved there (provided suitable non-volatile storage is available).

Obviously, where a receiver has a functioning RTC, it should be able to keep its own sense of time, but where no RTC is fitted (or power is completely turned off), providing a time estimate via the [UBX-MGA-INI-TIME_UTC](#) message will be beneficial.

Similarly, where a receiver has effective non-volatile storage, the last known position will be recalled, but if this is not the case, then it will help TTFF to provide a position estimate via one of the [UBX-MGA-INI-POS_XYZ](#) or [UBX-MGA-INI-POS_LLH](#) messages.

Where circumstance prevent the provision of all three of these pieces of data, providing some is likely to be better than none at all.

11.4.5 Flash-based AssistNow Offline

Flash-based AssistNow Offline functionality means that AssistNow Offline data is stored in the flash memory connected to the chip.

The user's host system must download the data from the AssistNow Offline service when an Internet connection is available, and then deliver all of that data to the u-blox receiver. As the total amount of data to be uploaded is large (typically around 100 kbytes) and writing to flash memory is slow, the upload must be done in blocks of up to 512 bytes, one at a time. The [UBX-MGA-FLASH-DATA](#) message is used to transmit each block to the receiver.

AssistNow Offline data stored in flash memory is not affected by any reset of the receiver. The only

simple ways to clear it are to completely erase the whole flash memory or to overwrite it with a new set of AssistNow Offline data. Uploading a dummy block of data (e.g. all zeros) will also have the effect of deleting the data, although a small amount of flash storage will be used.

11.4.5.1 Flash-based Storage Procedure

The following steps are a typical sequence for transferring AssistNow Offline data into the receiver's flash memory:

- The host downloads a copy of a latest data from the AssistNow Offline service and stores it locally.
- It sends the first 512 bytes of that data using the [UBX-MGA-FLASH-DATA](#) message.
- It awaits a [UBX-MGA-FLASH-ACK](#) message in reply.
- Based on the contents of the [UBX-MGA-FLASH-ACK](#) message it, sends the next block, resends the last block or aborts the whole process.
- The above three steps are repeated until all the rest of the data has been successfully transferred (or the process has been aborted).
- The host sends an [UBX-MGA-FLASH-STOP](#) message to indicate completion of the upload.
- It awaits the final [UBX-MGA-FLASH-ACK](#) message in reply. Background processing in the receiver prepares the downloaded data for use at this stage. Particularly if the receiver is currently busy, this may take quite a few seconds, so the host has to be prepared for a delay before the [UBX-MGA-FLASH-ACK](#) is seen.

Note that the final block may be smaller than 512 bytes (where the total data size is not perfectly divisible by 512). Also, the [UBX-MGA-FLASH-ACK](#) messages are distinct from the [UBX-MGA-ACK](#) messages used for other AssistNow functions.

Any existing data will be deleted as soon as the first block of new data arrives, so no useful data will be available till the completion of the data transfer. Each block of data has a sequence number, starting at zero for the first block. In order to guard against invalid partial data downloads the receiver will not accept blocks which are out of sequence.

11.4.6 Host-based AssistNow Offline

Host-based AssistNow Offline involves AssistNow Offline data being stored until it is needed by the user's host system in whatever memory it has available.

The user's host system must download the data from the AssistNow Offline service when an Internet connection is available, but retain it until the time the u-blox receiver needs it. At this point, the host must upload just the relevant portion of the data to the receiver, so that the receiver can start using it. This is achieved by parsing all the data and selecting for upload to the receiver only those [UBX-MGA-ANO](#) messages with a date-stamp nearest the current time. As each is a complete UBX message it can be sent directly to the receiver with no extra packaging. If required the user can select to employ [flow control](#), but in most cases this is likely to prove unnecessary.

When parsing the data obtained from the AssistNow Offline service the following points should be noted:

- The data is made up of a sequence of [UBX-MGA-ANO](#) messages
- Customers should not rely on the messages all being a fixed sized, but should read their length from the UBX header to work out where the message ends (and where the next begins).
- Each message indicates the SV for which it is applicable through the svld and gnssld fields.
- Each message contains a date-stamp within the year, month and day fields.
- Midday (UTC) on the day indicated should be considered to be the point at which the data is most applicable.

- The messages will be ordered chronologically, earliest first.
- Messages with same date-stamp will be ordered by ascending gnssId and then ascending svld.

11.4.6.1 Host-based Procedure

The following steps are a typical sequence for host-based AssistNow Offline:

- The host downloads a copy of a latest data from the AssistNow Offline service and stores it locally.
- Optionally it may also download a current set of almanac data from the AssistNow Online service.
- It waits until it wants to use the u-blox receiver.
- If necessary it uploads any almanac, position estimate and/or time estimate to the receiver.
- It scans through AssistNow Offline data looking for entries with a date-stamp that most closely matches the current (UTC) time/date.
- It sends each such [UBX-MGA-ANO](#) message to the receiver.

Note that when data has been downloaded from the AssistNow Offline service with the (default) resolution of one day, the means for selecting the closest matching date-stamp is simply to look for ones with the current (UTC) date.

11.5 Preserving Information During Power-off

The performance of u-blox receivers immediately after they are turned on is enhanced by providing them with as much useful information as possible. Assistance (both [Online](#) and [Offline](#)) is one way to achieve this, but retaining information from previous use of the receiver can be just as valuable. All the [types of data delivered by assistance](#) can be retained while the receiver is powered down for use when power is restored. Obviously the value of this data will diminish as time passes, but in many cases it remains very useful and can significantly improve time to first fix.

There are several ways in which a u-blox receiver can retain useful data while it is powered down, including:

- **Battery Backed RAM:** The receiver can be supplied with sufficient power to maintain a small portion of internal storage, while it is otherwise turned off. This is the best mechanism, provided that the small amount of electrical power required can be supplied continuously.
- **Save on Shutdown:** The receiver can be instructed to dump its current state to the attached flash memory (where fitted) as part of the shutdown procedure; this data is then automatically retrieved when the receiver is restarted. See the description of the [UBX-UPD-SOS](#) messages for more information.
- **Database Dump:** The receiver can be asked to dump the state of its internal database in the form of a sequence of UBX messages reported to the host; these messages can be stored by the host and then sent back to the receiver when it has been restarted. See the description of the [UBX-MGA-DBD](#) messages for more information.

11.6 AssistNow Autonomous

(Note: some functionality described in this chapter may not be available in [protocol versions less than 18](#)).

11.6.1 Introduction

The assistance scenarios covered by *AssistNow Online* and *AssistNow Offline* require an online connection and a host that can use this connection to download aiding data and provide this to the receiver when required.

The *AssistNow Autonomous* feature provides a functionality similar to *AssistNow Offline* without the need for a host and a connection. Based on a broadcast ephemeris downloaded from the satellite (or obtained by *AssistNow Online*) the receiver can autonomously (i.e. without any host interaction or online connection)

generate an accurate satellite orbit representation («AssistNow Autonomous data») that is usable for navigation much longer than the underlying broadcast ephemeris was intended for. This makes downloading new ephemeris or aiding data for the first fix unnecessary for subsequent start-ups of the receiver.

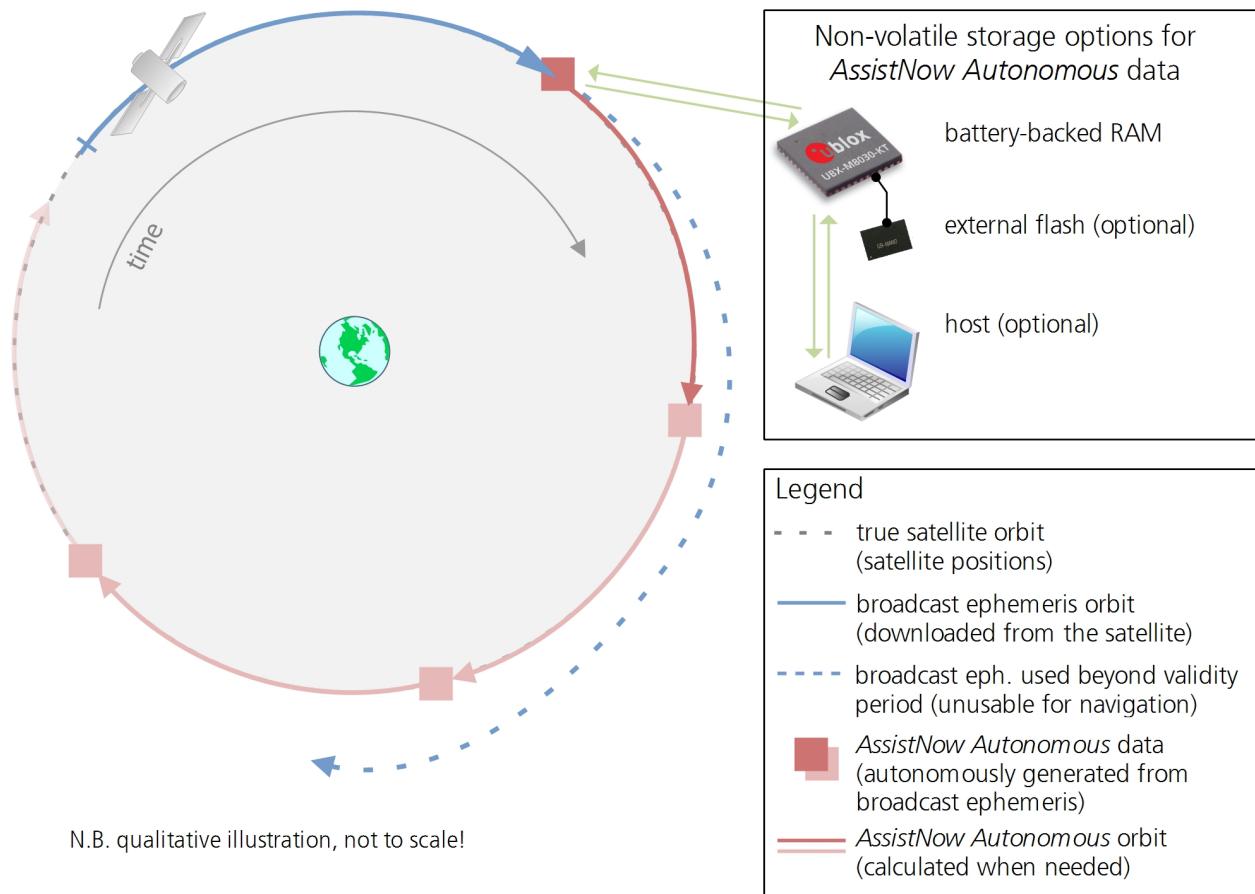

The AssistNow Autonomous feature is disabled by default. It can be enabled using the [UBX-CFG-NAVX5](#) message.

11.6.2 Concept

The figure below illustrates the *AssistNow Autonomous* concept in a graphical way. Note that the figure is a qualitative illustration and is not to scale.

- A broadcast ephemeris downloaded from the satellite is a precise representation of a part (for GPS nominally four hours) of the satellite's true orbit (trajectory). It is not usable for positioning beyond this validity period because it diverges dramatically from the true orbit afterwards.
- The *AssistNow Autonomous orbit* is an extension of one or more broadcast ephemerides. It provides a long-term orbit for the satellite for several revolutions. Although this orbit is not perfectly precise it is a sufficiently accurate representation of the true orbit to be used for navigation.
- The *AssistNow Autonomous data* is automatically and autonomously generated from downloaded (or assisted) ephemerides. The data is stored automatically in the on-chip battery-backed memory (BBR). Optionally, the data can be backed-up in external flash memory or on the host. The number of satellites for which data can be stored depends on the receiver configuration and may change during operation.
- If no broadcast ephemeris is available for navigation *AssistNow Autonomous* automatically generates the required parts of the orbits suitable for navigation from the stored data. The data is also automatically kept current in order to minimize the calculation time once the navigation engine needs orbits.
- The operation of the *AssistNow Autonomous* feature is transparent to the user and the operation of the receiver. All calculations are done in background and do not affect the normal operation of the receiver.
- The *AssistNow Autonomous* subsystem automatically invalidates data that has become too old and that would introduce unacceptable positioning errors. This threshold is configurable (see below).
- The prediction quality will be automatically improved if the satellite has been observed multiple times. However, this requires the availability of a suitable flash memory (see the *Hardware Integration Manual* for a list of supported devices). Improved prediction quality also positively affects the maximum usability period of the data.
- *AssistNow Autonomous* considers GPS, GLONASS, Galileo and BeiDou satellites only. It will not consider satellites on orbits with an eccentricity of >0.05 (e.g., Galileo E18). For GLONASS support a suitable flash memory is mandatory because a single broadcast ephemeris spans to little of the orbit (only approx. 30 minutes) in order to extend it in a usable way. Only multiple observations of the same GLONASS satellite that span at least four hours will be used to generate data.

11.6.3 Interface

Several UBX protocol messages provide interfaces to the *AssistNow Autonomous* feature. They are:

- The [UBX-CFG-NAVX5](#) message is used to enable or disable the *AssistNow Autonomous* feature. It is disabled by default. Once enabled, the receiver will automatically produce *AssistNow Autonomous* data for newly received broadcast ephemerides and, if that data is available, automatically provide the navigation subsystem with orbits when necessary and adequate. The message also allows for a configuration of the maximum acceptable orbit error. See the next section for an explanation of this feature. It is recommended to use the firmware default value that corresponds to a default orbit data validity of approximately three days (for GPS satellites observed once) and up to six days (for GPS and GLONASS satellites observed multiple times over a period of at least half a day).
- Note that disabling the *AssistNow Autonomous* feature will delete all previously collected satellite observation data from the flash memory.
- The [UBX-NAV-AOPSTATUS](#) message provides information on the current state of the *AssistNow Autonomous* subsystem. The status indicates whether the *AssistNow Autonomous* subsystem is currently idle (or not enabled) or busy generating data or orbits. Hosts should monitor this information and only power-off the receiver when the subsystem is idle (that is, when the `status` field shows a steady zero).
- The [UBX-NAV-SAT](#) message indicates the use of *AssistNow Autonomous* orbits for individual satellites.
- The [UBX-NAV-ORB](#) message indicates the availability of *AssistNow Autonomous* orbits for individual satellites.
- The [UBX-MGA-DBD](#) message provides a means to retrieve the *AssistNow Autonomous* data from the receiver

in order to preserve the data in power-off mode where no battery backup is available. Note that the receiver requires the absolute time (i.e. full date and time) to calculate *AssistNow Autonomous* orbits. For best performance it is, therefore, recommended to supply this information to the receiver using the [UBX-MGA-INI-TIME_UTC](#) message in this scenario.

- The [Save-on-Shutdown](#) feature preserves *AssistNow Autonomous* data.

11.6.4 Benefits and Drawbacks

AssistNow Autonomous can provide quicker start-up times (lower the TTFF) provided that data is available for enough visible satellites. This is particularly true under weak signal conditions where it might not be possible to download broadcast ephemerides at all, and, therefore, no fix at all would be possible without *AssistNow Autonomous* (or A-GNSS). It is, however, required that the receiver roughly know the absolute time, either from an RTC or from time-aiding (see the *Interface* section above), and that it knows which satellites are visible, either from the almanac or from tracking the respective signals.

The *AssistNow Autonomous* orbit (satellite position) accuracy depends on various factors, such as the particular type of satellite, the accuracy of the underlying broadcast ephemeris, or the orbital phase of the satellite and Earth, and the age of the data (errors add up over time).

AssistNow Autonomous will typically extend a broadcast ephemeris for up to three to six days. The [UBX-CFG-NAVX5](#) (see above) message allows changing this threshold by setting the «maximum acceptable modelled orbit error» (in meters). Note that this number does not reflect the true orbit error introduced by extending the ephemeris. It is a statistical value that represents a certain expected upper limit based on a number of parameters. A rough approximation that relates the maximum extension time to this setting is: $\text{maxError [m]} = \text{maxAge [d]} * f$, where the factor f is 30 for data derived from satellites seen once and 16 for data derived for satellites seen multiple time during a long enough time period (see the *Concept* section above).

There is no direct relation between (true and statistical) orbit accuracy and positioning accuracy. The positioning accuracy depends on various factors, such as the satellite position accuracy, the number of visible satellites, and the geometry (DOP) of the visible satellites. Position fixes that include *AssistNow Autonomous* orbit information may be significantly worse than fixes using only broadcast ephemerides. It might be necessary to adjust the limits of the [Navigation Output Filters](#).

A fundamental deficiency of any system to predict satellite orbits precisely is unknown future events. Hence, the receiver will not be able to know about satellites that will have become unhealthy, have undergone a clock swap, or have had a manoeuvre. This means that the navigation engine might rarely mistake a wrong satellite position as the true satellite position. However, provided that there are enough other good satellites, the navigation algorithms will eventually eliminate a defective orbit from the navigation solution.

The repeatability of the satellite constellation is a potential pitfall for the use of the *AssistNow Autonomous* feature. For a given location on Earth the (GPS) constellation (geometry of visible satellites) repeats every 24 hours. Hence, when the receiver «learned» about a number of satellites at some point in time the same satellites will in most places *not* be visible 12 hours later, and the available *AssistNow Autonomous* data will not be of any help. Again 12 hours later, however, usable data would be available because it had been generated 24 hours ago.

The longer a receiver observes the sky the more satellites it will have seen. At the equator, and with full sky view, approximately ten (GPS) satellites will show up in a one hour window. After four hours of observation approx. 16 satellites (i.e. half the constellation), after 10 hours approx. 24 satellites (2/3rd of the constellation), and after approx. 16 hours the full constellation will have been observed (and *AssistNow Autonomous* data generated for). Lower sky visibility reduces these figures. Further away from the equator the numbers improve because the satellites can be seen twice a day. E.g. at 47 degrees north the full constellation can be observed in

approx. 12 hours with full sky view.

The calculations required for *AssistNow Autonomous* are carried out on the receiver. This requires energy and users may therefore occasionally see increased power consumption during short periods (several seconds, rarely more than 60 seconds) when such calculations are running. Ongoing calculations will automatically prevent the **power save mode** from entering the power-off state. The power-down will be delayed until all calculations are done.

The AssistNow Offline and AssistNow Autonomous features are exclusive and should not be used at the same time. Every satellite will be ignored by AssistNow Autonomous if there is AssistNow Offline data available for it.

12 Power Management

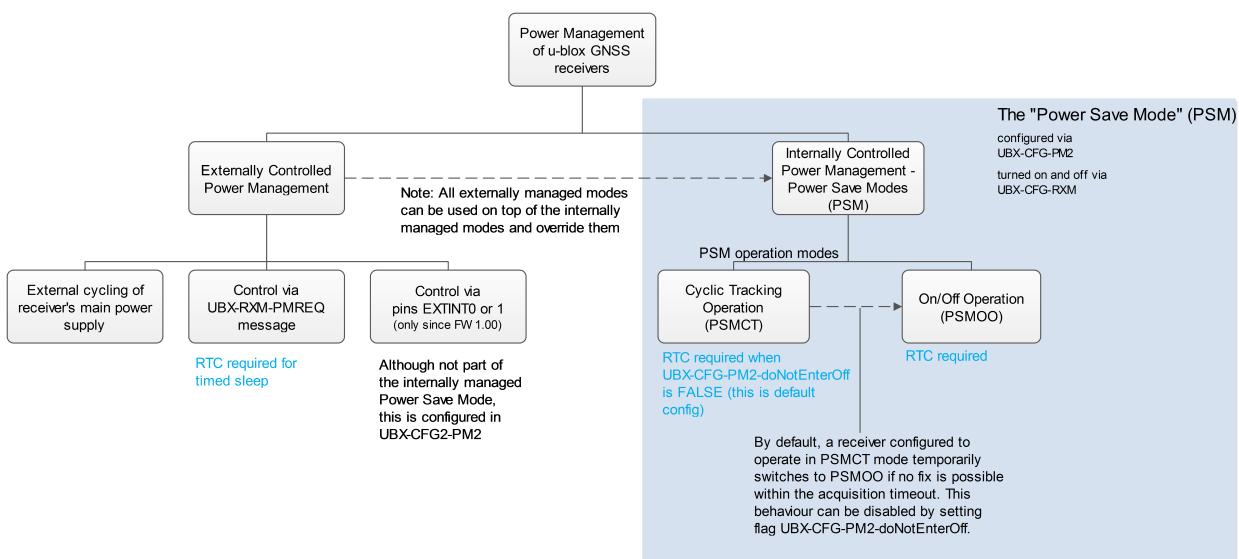

u-blox receivers support different power modes. These modes represent strategies of how to control the acquisition and tracking engines in order to achieve either the best possible performance or good performance with reduced power consumption.

Receiver power management can split into two categories:

- Externally Controlled Power Management: This includes various modes of power management that are directly operated by the user or host device. These modes are: 1. External cycling of the receiver main power supply. 2. Instruct the receiver to turn On/Off via the **UBX-RXM-PMREQ** message. 3. Instruct the receiver to turn On/Off via **external pins** (EXTINT0 or EXTINT1)
- Internally Controlled Power Management: Here the receiver makes the decision when to power down/up some/all of its internal components according to predefined parameters. It is also referred to as Power Save Modes (PSM). It has two modes of operations: 1. ON/OFF Operation (**PSMOO**) 2. Cyclic Tracking (**PSMCT**).

The following figure illustrates u-blox power management modes.

u-blox Power Management

The majority of the Power Management section is detailing the Power Save Mode (Internally Controlled Power Management). However, some the concepts relevant to the Externally Controlled Power Management are detailed, such as the **EXTINT Control**, **Wake up** and **Power On/Off Command**.

Externally controlled power management operations can be used on top of the Internally Controlled Power Management and they do override their operation.

12.1 Continuous Mode

u-blox receivers make use of dedicated signal processing engines optimized for signal acquisition and tracking. The acquisition engine delivers rapid signal searches during cold starts or when insufficient signals are available for navigation. The tracking engine delivers signal measurements for navigation and acquires new signals as they become available during navigation. The resources of both engines are deployed adaptively to minimize overall power consumption.

12.2 Power Save Mode

Power Save Mode (PSM) allows a reduction in system power consumption by selectively switching parts of the receiver on and off. It is selected using the message [UBX-CFG-RXM](#) and configured using [UBX-CFG-PM2](#).

PSM is designed to only support the operation of GPS, GLONASS, BeiDou, Galileo and QZSS. Enabling SBAS or IMES is possible only if at least one of the other systems is enabled. The PSM state machine behavior will not be altered by enabling SBAS or IMES and it will not take them into account in operation. Therefore, it is recommended to disable them (i.e., SBAS or IMES) when operating in Power Save Mode. They can be disabled using [UBX-CFG-GNSS](#).

The logic within Power Save Mode is designed so that Time Pulse operation is not compromised.

This means that entering all power saving states is delayed until the conditions necessary to produce a Time Pulse have been met. Therefore, in order to obtain good Power Save Mode operation, it is essential that any Time Pulse is correctly configured with an appropriate time base, or that Time Pulses are turned off if not needed (by clearing the active flag in [UBX-CFG-TP5](#)).

For protocol versions less than 18: Power Save Mode can only be selected with GPS signals. Other GNSS are not supported.

Note: Power Save Mode is not supported in conjunction with the ADR, UDR and FTS products.

12.2.1 Operation

Power Save Mode has two modes of operation:

- *Power Save Mode Cyclic Tracking (PSMCT) Operation* is used when position fixes are required in short periods of 1 to 10s
- *Power Save Mode ON/OFF (PSMOO) Operation* is used for periods longer than 10s, and can be in the order of minutes, hours or days.

The mode of operation can be configured, and depending on the setting, the receiver demonstrates different behavior: In ON/OFF operation the receiver switches between phases of start-up/navigation and phases with low or almost no system activity (backup/sleep). In cyclic tracking the receiver does not shut down completely between fixes, but uses low power tracking instead.

Currently PSMCT is restricted to update period between 1 and 10 seconds and PSMOO is restricted to update period over 10 seconds. However, this may change in future firmware releases.

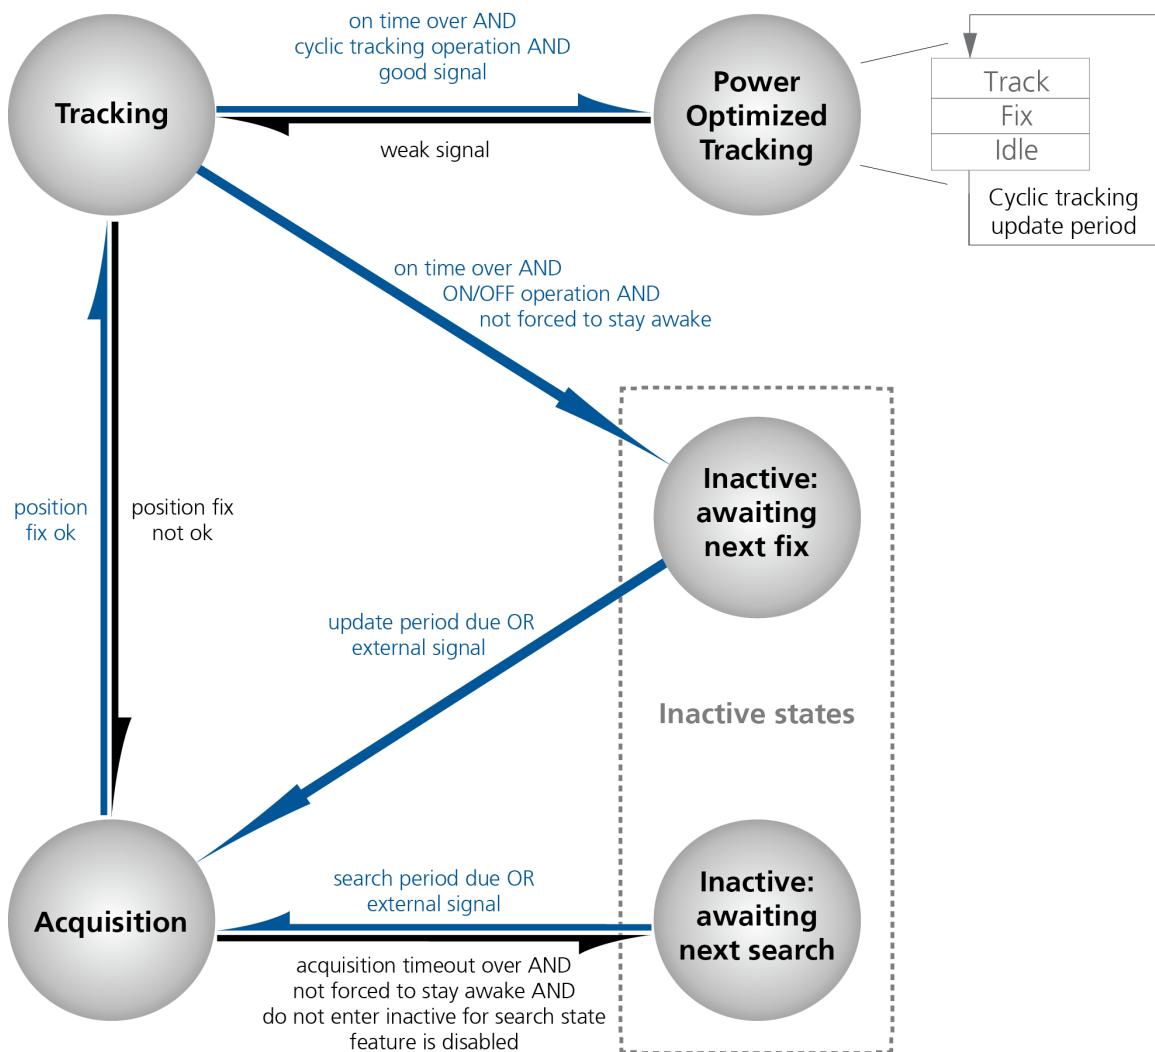

PSM is based on a state machine with five different states: (*Inactive*) Awaiting Next Fix and (*Inactive*) Awaiting Next Search states, Acquisition state, Tracking state and Power Optimized Tracking (POT) state.

- *Inactive* states: Most parts of the receiver are switched off.
- *Acquisition* state: The receiver actively searches for and acquires signals. Maximum power consumption.
- *Tracking* state: The receiver continuously tracks and downloads data. Less power consumption than in Acquisition state.
- *POT* state: The receiver repeatedly loops through a sequence of tracking (Track), calculating the position fix

(Fix), and entering an idle period (Idle). No new signals are acquired and no data is downloaded. Much less power consumption than in *Tracking* state.

The following figure illustrates the PSM state machine:

State machine

12.2.1.1 Acquisition Timeout Logic

The receiver has internal, external and user configurable mechanisms that determine the time to be spent in acquisition state. This logic is put in place to ensure good performance and low power consumption in different environments and scenarios. This collective logic is referred to as Acquisition Timeout.

Internal mechanisms:

- If the receiver is able to acquire weak signals but not of the quality needed to get a fix, it will transition to (*Inactive*) *Awaiting Next Search* state after the timeout configured in *maxStartupStateDur* or earlier if too few signals are acquired.
- If the receiver is unable to acquire any signals or it acquires a small number of extremely bad signals (e.g., no sky view), it will transition to (*Inactive*) *Awaiting Next search* state after 15 seconds or the timeout configured in *maxStartupStateDur* if shorter.

User configurable mechanisms:

- *minAcqTime* is the minimum time that the receiver will spend in *Acquisition* state (see [minAcqTime](#) for details.)
- *maxStartupStateDur* is the maximum time that the receiver will spend in *Acquisition* state (see [maxStartupStateDur](#) for details).
- *doNotEnterOff* forces the receiver to stay awake and in *Acquisition* state even when a fix is not possible (see [doNotEnterOff](#) for details).

External mechanisms:

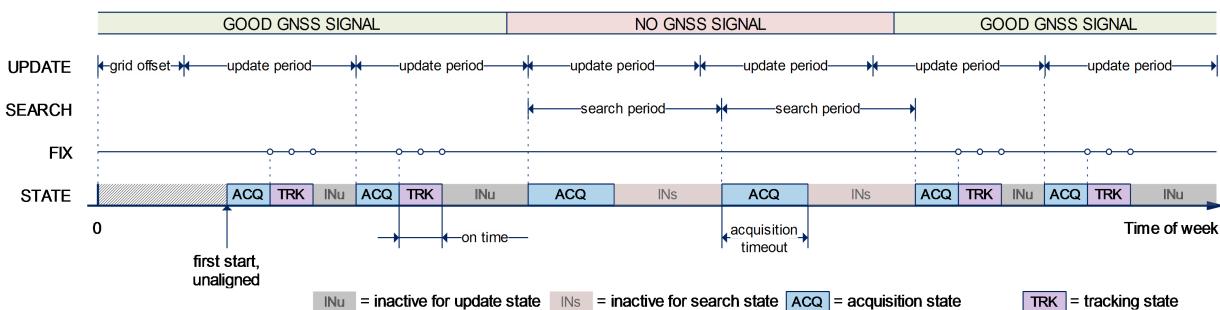

- The receiver will be forced to stay awake if *extintWake* is enabled and the configured EXTINT pin is set to "high" and it will be forced to stay in (*Inactive*) *Awaiting Next Search/Fix* states if *extintBackup* is enabled and the configured EXTINT pin is set to "low" (see [EXTINT pin control](#) for details).

12.2.1.2 ON/OFF operation - long update period

When the receiver is switched on, it first enters *Acquisition* state. If it is able to obtain a valid position fix within the time given by the [Acquisition Timeout](#), it switches to *Tracking* state. Otherwise it enters (*Inactive*) *Awaiting Next Search* state and re-starts after the configured search period (minus a start-up margin). As soon as the receiver gets a valid position fix (one passing the [navigation output filters](#)), it enters *Tracking* state. Upon entering *Tracking* state, the *onTime* starts. Once the *onTime* is over, (*Inactive*) *Awaiting Next Fix* state is entered and the receiver re-starts according to the configured update grid (see section [Grid offset](#) for an explanation). If the signal is lost while in *Tracking* state, *Acquisition* state is entered. If the signal is not found within the acquisition timeout, the receiver enters (*Inactive*) *Awaiting Next Search* state. Otherwise the receiver will re-enter *Tracking* state and stay there until the newly started *onTime* is over.

The diagram below illustrates how ON/OFF operation works:

Diagram of ON/OFF operation

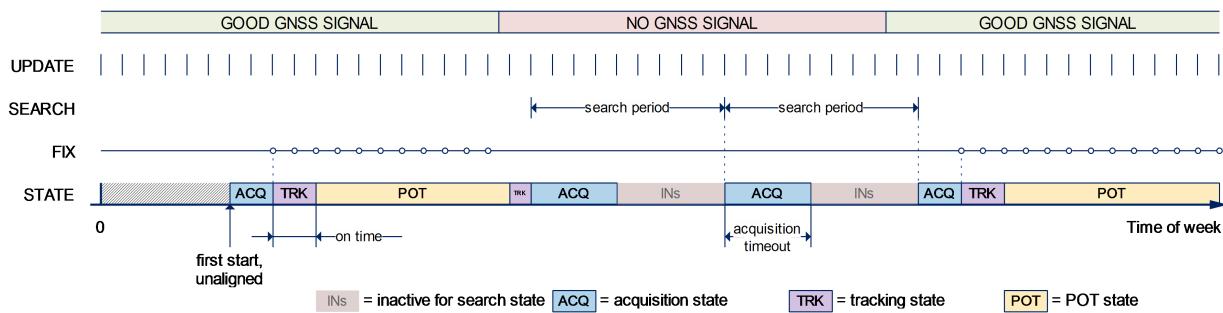

12.2.1.3 Cyclic tracking operation - short update period

When the receiver is switched on, it first enters *Acquisition* state. If it is able to obtain a position fix within the time given by the acquisition timeout, it switches to *Tracking* state. Otherwise, it will enter (*Inactive*) *Awaiting Next Search* state and re-start within the configured search grid. After a valid position fix, *Tracking* state is entered and the *onTime* starts. In other words the *onTime* starts with the first valid position fix. Once the *onTime* is over, *POT* state is entered. In *POT* state the receiver continues to output position fixes according to the *updatePeriod*. To have maximum power savings, set the *onTime* to zero. This causes the receiver to enter *POT* state as soon as possible. If the signal becomes weak or is lost during *POT* state, *Tracking* state is entered. Once the signal is good again and the newly started *onTime* is over, the receiver will re-enter *POT* state. If the receiver can't get a position fix in the *Tracking* state, it enters *Acquisition* state. Should the acquisition fail as well, (*Inactive*) *Awaiting Next Search* state is entered. If *doNotEnterOff* is enabled and no fix is possible, the receiver will remain in *Acquisition* state until a fix is possible and it will never enter (*Inactive*) *Awaiting Next Search* state.

The diagram below illustrates how cyclic tracking operation works:

Diagram of cyclic tracking operation

12.2.1.4 User controlled operation - update and search period of zero

Setting the updatePeriod to zero causes the receiver to wait in the (*Inactive*) *Awaiting Next Fix* state until woken up by the user. Setting the search period to zero causes the receiver to wait in the (*Inactive*) *Awaiting Next Search* state indefinitely after an unsuccessful start-up. Any wake-up event will re-start the receiver. See section [Wake up](#) for more information on wake-up events.

External wake-up is required when setting update or search period to zero.

12.2.1.5 Satellite data download

The receiver is not able to download satellite data (e.g. the ephemeris) while it is working in ON/OFF or cyclic tracking operation. Therefore it has to temporarily switch to continuous operation for the time the satellites transmit the desired data. To save power the receiver schedules the downloads according to an internal timetable and only switches to continuous operation while data of interest is being transmitted by the satellites.

Each SV transmits its own ephemeris data. Ephemeris data download is feasible when the corresponding satellite has been tracked with a sufficient C/No over a certain period of time. The download is scheduled in a 30 minute grid or immediately when fewer than a certain number of visible satellites have valid ephemeris data. Almanac, ionosphere, UTC correction and SV health data are transmitted by all SVs simultaneously. Therefore these parameters can be downloaded when a single SV is tracked with a high enough C/No.

Allowing more ephemerides to be downloaded before going into *POT* or (*Inactive*) *Awaiting Next Fix* state can help improve the quality of the fixes and reduce the number of wake ups needed to download ephemerides at the cost of extra time in *Acquisition* state (only when an inadequate number of ephemerides are downloaded from tracked satellites).

12.2.2 Configuration

Power Save Mode is enabled and disabled with the [UBX-CFG-RXM](#) message and configured with the [UBX-CFG-PM2](#) message.

When enabling Power Save Mode, the receiver will be unable to download or process any SBAS or IMES data. Therefore, there is no benefit in enabling them and it is recommended to disable both systems. SBAS support and IMES support can be disabled using [UBX-CFG-GNSS](#).

A number of parameters can be used to customize PSM to your specific needs. These parameters are listed in the following table:

Power Save Mode configuration options on UBX-CFG-PM2

| Parameter | Description |
|-----------|----------------------------|
| mode | Receiver mode of operation |

Power Save Mode configuration options on UBX-CFG-PM2 continued

| Parameter | Description |
|--------------------|---|
| updatePeriod | Time between two position fix attempts |
| searchPeriod | Time between two acquisition attempts if the receiver is unable to get a position fix |
| minAcqTime | Minimum time the receiver spends in <i>Acquisition</i> state |
| onTime | Time the receiver remains in <i>Tracking</i> state and produces position fixes |
| waitTimeFix | Wait for time fix before entering <i>Tracking</i> state |
| doNotEnterOff | Receiver does not enter (<i>Inactive</i>) <i>Awaiting Next Search</i> state if it can't get a position fix but keeps indefinitely attempting a position fix instead |
| updateRTC | Enables periodic Real Time Clock (RTC) update |
| updateEPH | Enables periodic ephemeris update |
| extintSelect | Selects EXTINT pin used with pin control feature |
| extintWake | Enables force-ON pin control feature |
| extintBackup | Enables force-OFF pin control feature |
| gridOffset | Time offset of update grid with respect to start of week |
| maxStartupStateDur | Maximum time in <i>Acquisition</i> state |

12.2.2.1 Mode of operation (mode)

The mode of operation to use mainly depends on the update period: For short update periods (in the range of a few seconds), cyclic tracking should be configured. For long update periods (in the range of minutes or longer), only use ON/OFF operation.

See section [ON/OFF operation - long update period](#) and [Cyclic tracking operation - short update period](#) for more information on the two modes of operation.

12.2.2.2 Reference Time Standard

In older versions (in [protocol versions less than 18](#)), only GPS can be configured for PSM, therefore, GPS time standard is used for the operation of PSM. Whereas, in newer versions where multiple GNSS can operate simultaneously (in [protocol versions 18+](#)), UTC time standard is used.

12.2.2.3 Update period (updatePeriod) and search period (searchPeriod)

The update period specifies the time between successive position fixes. If no position fix can be obtained within the acquisition timeout, the receiver will retry after the time specified by the search period. Update and search periods are fixed with respect to an absolute time grid based on reference time standard (i.e., GPS Time or UTC. see [Reference Time Standard](#)). They do not refer to the time of the last valid position fix or last position fix attempt.

New settings are ignored if the update period or the search period exceeds the maximum number of milliseconds in a week. In that case the previously stored values remain effective.

12.2.2.4 Minimum Acquisition Time (minAcqTime)

The receiver tries to obtain a position fix for at least the time given in minAcqTime. If the receiver determines that it needs more time for the given starting conditions then it will automatically prolong this time. If minAcqTime is set to zero then the minimum acquisition time is exclusively determined by the receiver. Once the minAcqTime has expired, the receiver will terminate the acquisition state if either a fix is achieved or if the receiver estimates that any signals received are insufficient (too weak or too few) for a fix to be possible.

12.2.2.5 On time (onTime)

The *onTime* parameter specifies how long the receiver stays in *Tracking* state before switching to the *POT* state (in PSMCT) or (*Inactive*) *Awaiting Next Fix* state (in PSMOO).

12.2.2.6 Wait for time fix (waitTimeFix)

A time fix is a fix type in which the receiver will ensure that the time is accurate and confirmed to within the limits set in [UBX-CFG-NAV5](#). Enabling the *waitTimeFix* option will force the receiver to stay in *Acquisition* state until the time is known to within the configured limits then it will transition to *Tracking* state. Enabling *waitTimeFix* will delay the transition from *Acquisition* state to *Tracking* state by at least two extra seconds, thus, this should be taken into account (see [Acquisition Timeout](#)). It is necessary to enable *waitTimeFix* in timing products.

The quality of the position fixes can also be configured by setting the limits in the message [UBX-CFG-NAV5](#). Setting harder limits in [UBX-CFG-NAV5](#) will typically prolong the time in *Acquisition* state. Thus, ensuring sufficient time is given to the receiver at start-up (when externally controlled) is necessary (see [Acquisition Timeout Logic](#)). When internally controlled, the receiver can make good judgement on the time needed in *Acquisition* state and no further adjustments will be needed.

12.2.2.7 Maximum Startup State Duration (maxStartupStateDur)

(only supported in [protocol versions 17+](#)).

The *maxStartupStateDur* is the maximum time that the receiver will spend in *Startup* state (i.e., *Acquisition* state). If the receiver is unable to acquire a valid position fix within this maximum time, it will transition to (*Inactive*) *Awaiting Next Search* state (if *doNotEnterOff* is disabled). Subsequently, the receiver will attempt to acquire another position fix according to the search period (see [Update period \(updatePeriod\) and search period \(searchPeriod\)](#)). If *maxStartupStateDur* is set to zero, the receiver will autonomously determine the maximum time to spend in *Acquisition* state. Note that shorter settings (below about 45s) will degrade an unaided receiver's ability to collect new Ephemeris data at low signal levels (see section [Satellite data download](#)).

12.2.2.8 Do not enter '(Inactive) Awaiting Next Search' state when no fix (doNotEnterOff)

If this option is enabled, the receiver acts differently in case it can't get a fix: instead of entering (*Inactive*) *Awaiting Next Search* state, it keeps attempting to acquire a position fix. In other words, the receiver will never be in (*Inactive*) *Awaiting Next Search* state and therefore *searchPeriod* and *minAcqTime* will be ignored.

12.2.2.9 Update RTC (updateRTC) and Ephemeris (updateEPH)

To maintain the ability of a fast start-up, the receiver needs to calibrate its RTC and update its ephemeris data on a regular basis. This can be ensured by activating the update RTC and update Ephemeris option. The RTC is calibrated every 5 minutes and the ephemeris data is updated approximately every 30 minutes. See section [Satellite data download](#) for more information.

12.2.2.10 EXTINT pin control

The operation of PSM can be externally controlled using either EXTINT0 or EXTINT1 pin. This external control allows the user to decide when to wake up the receiver to obtain a fix and when to force the receiver into sleep/backup mode to save power. Operating the receiver externally through the EXTINT pins will override internal functions that coincide with that specific operation.

The choice of which pin to use can be configured through the *extintSelect* feature in [UBX-CFG-PM2](#). Only one pin can be selected at a time but it is sufficient to perform all the required tasks.

If the Force-ON (*extintWake*) feature in [UBX-CFG-PM2](#) is enabled, the receiver will not enter Inactive states for

as long as the configured EXTINT pin (EXTINT0 or EXTINT1) is at 'high' level. The receiver will therefore always be in *Acquisition/Tracking* state in PSMOO or in *Acquisition/Tracking/POT* state in PSMCT. When the pin level changes to 'low' the receiver will continue with its configured behavior.

If the Force-OFF (*extintBackup*) feature in [UBX-CFG-PM2](#) is enabled, the receiver will enter Inactive states for as long as the configured EXTINT pin is set to 'low' until the next wake up event. Any wake-up event can wake up the receiver even while the EXTINT pin is set to 'low' (see [Wake up](#)). However, if the pin stay at 'low' state, the receiver will only wake up for the time needed to read the configuration pin settings then it will enter the Inactive state again.

If both Force-ON and Force-OFF features are enabled at the same time, the receiver PSM operation will be completely in user control. Setting 'high' on the configured EXTINT pin will wake up the receiver to get a position fix and setting 'low' will put the receiver into sleep/backup mode.

12.2.2.11 Grid offset (gridOffset)

Once the receiver has a valid time, the update grid is aligned to the start of the week of the [reference time standard](#) (midnight between Saturday and Sunday). Before having a valid time, the update grid is unaligned. A grid offset shifts the update grid with respect to the start of the week of the [reference time standard](#). An example of usage can be found in section [Use grid offset](#).

The grid offset is not used in cyclic tracking operation.

12.2.3 Features

12.2.3.1 Communication

When PSM is enabled, communication with the receiver (e.g. UBX message to disable PSM) requires particular attention. This is because the receiver may be in *Inactive* state and therefore unable to receive any message through its interfaces. To ensure that the configuration messages are processed by the receiver, even while in *Inactive* state, the following steps need to be taken:

- Send a dummy sequence of 0xFF (one byte is sufficient) to the receiver's UART interface. This will wake up the receiver if it is in *Inactive* state. If the receiver is not in *Inactive* state, the sequence will be ignored.
- Send the configuration message about half a second after the dummy sequence. If the interval between the dummy sequence and the configuration message is too short, the receiver may not yet be ready. If the interval is too long, the receiver may return to *Inactive* state before the configuration message was received. It is therefore important to check for a [UBX-ACK-ACK](#) reply from the receiver to confirm that the configuration message was received.
- Send the configuration save message immediately after the configuration message.

Similarly, when configuring the receiver for PSMOO (and PSMCT when doNotEnterOff is disabled), ensure that the configurations are saved. If they are not saved the receiver will enter backup mode and when it wakes up again, it would have lost the configurations and even forgets it was in power save mode. This can be avoided by using the [UBX-CFG-CFG](#) message (see [Receiver Configuration](#) for details). When operating PSM from u-Center and setting the receiver to Power Save Mode in [UBX-CFG-RXM](#), check the save configuration box. u-Center will then send a [UBX-CFG-CFG](#) message after the [UBX-CFG-RXM](#) to save the configurations.

12.2.3.2 Wake up

The receiver can be woken up by generating an edge on one of the following pins:

- rising or falling edge on one of the EXTINT pins
- rising or falling edge on the RXD1 pin

- rising or falling edge on the SPI CS pin
- rising edge on NRESET pin

All wake-up signals are interpreted as a position request, where the receiver wakes up and tries to obtain a position fix. Wake-up signals have no effect if the receiver is already in *Acquisition*, *Tracking* or *POT* state.

12.2.3.3 Behavior while USB host connected

As long as the receiver is connected to a USB host, it will not enter the lowest possible power state. This is because it must retain a small level of CPU activity to avoid breaching requirements of the USB specification. The drawback, however, is that power consumption is higher.

 *Wake up by pin/UART is possible even if the receiver is connected to a USB host. In this case the state of the pin must be changed for a duration longer than one millisecond.*

12.2.3.4 Cooperation with the AssistNow Autonomous feature

If both PSM and *AssistNow Autonomous* features are enabled, the receiver won't enter (*Inactive*) *Awaiting Next Fix* state as long as *AssistNow Autonomous* carries out calculations. This prevents losing data from unfinished calculations and, in the end, reduces the total extra power needed for *AssistNow Autonomous*. The delay before entering (*Inactive*) *Awaiting Next Fix* state, if any, will be in the range of several seconds, rarely more than 20 seconds.

Only entering (*Inactive*) *Awaiting Next Fix* state is affected by *AssistNow Autonomous*. In other words: in cyclic tracking operation, *AssistNow Autonomous* will not interfere with the PSM (apart from the increased power consumption).

 *Enabling the AssistNow Autonomous feature will lead to increased power consumption while prediction is calculated. The main goal of PSM is to reduce the overall power consumption. Therefore for each application special care must be taken to judge whether AssistNow Autonomous is beneficial to the overall power consumption or not.*

12.2.4 Examples

12.2.4.1 Use Grid Offset

Scenario: Get a position fix once a day at a fixed time. If the position fix cannot be obtained try again every two hours.

Solution: First set the update period to 24*3600s and the search period to 2*3600s. Now a position fix is obtained every 24 hours and if the position fix fails retrials are scheduled in two hour intervals. As the update grid is aligned to midnight Saturday/Sunday *reference time standard*, the position fixes happen at midnight *reference time standard*. By setting the grid offset to 12*3600s the position fixes are shifted to once a day at noon *reference time standard*. If the position fix at noon fails, retrials take place every two hours, the first at 14:00 *reference time standard*. Upon successfully acquiring a position fix the next fix attempt is scheduled for noon the following day.

12.2.4.2 User controlled position fix

Scenario: Get a position fix on request.

Solution: Set updatePeriod and searchPeriod to zero. Set extintSelect to the desired EXTINT pin to be used. Enable the extintWake and extintBackup features.

12.2.4.3 Use update periods of 30 minutes

Scenario: Get a position fix once every 30 minutes and acquire a fix needed for timing products

Solution: Set mode of operation to PSMOO. Set updatePeriod to 1800 seconds. Set the search period to 120 seconds. Enable waitTimeFix feature.

12.3 Peak current settings

The peak current during acquisition can be reduced by activating the corresponding option in [UBX-CFG-PM2](#). A peak current reduction will result in longer start-up times of the receiver.

This setting is independent of the activated mode (Continuous or Power Save Mode).

12.4 Power On/Off command

With message [UBX-RXM-PMREQ](#) the receiver can be forced to enter *Inactive* state (in Continuous and Power Save Mode). It will stay in *Inactive* state for the time specified in the message or until it is woken up by an EXTINT or activity on the RXD1, SPI CS, or NRESET pin.

Sending the message UBX-RXM-PMREQ while the receiver is in Power Save Mode will overrule PSM and force the receiver to enter Inactive state. It will stay in Inactive state until woken up. After wake-up the receiver continues working in Power Save Mode as configured.

12.5 EXTINT pin control when Power Save Mode is not active

The receiver can be forced OFF also when the Power Save Mode is not active. This works the same way as [EXTINT pin control in Power Save Mode](#). Just as in Power Save Mode, this feature has to be enabled and configured using [UBX-CFG-PM2](#)

12.6 Measurement and navigation rate with Power Save Mode

In Continuous Mode, measurement and navigation rate is configured using [UBX-CFG-RATE](#). In Power Save Mode however, measurement and navigation rate can differ from the configured rates as follows:

- **Cyclic Operation:** When in state *Power Optimized Tracking*, the measurement and navigation rate is determined by the *updatePeriod* configured in [UBX-CFG-PM2](#). The receiver can however switch to *Tracking* state (e.g. to download data). When in *Tracking* state, the measurement and navigation rate is as configured with [UBX-CFG-RATE](#). Note: When the receiver is no longer able to produce position fixes, it can switch from Cyclic Operation to ON/OFF Operation (if this is not disabled with the *doNotEnterOff* switch in [UBX-CFG-PM2](#)). In that case the remarks below are relevant.
- **ON/OFF Operation:** (in [protocol versions less than 18](#)) when in state *Acquisition*, the measurement and navigation rate is **fixed to 2Hz**. All NMEA (and UBX) messages that are output upon a navigation fix are also output with a rate of 2Hz. This must be considered when choosing the baud rate of a receiver that uses Power Save Mode! Note that a receiver might stay in *Acquisition* state for quite some time (can be tens of seconds under weak signal conditions). When the receiver eventually switches to *Tracking* state, the measurement and navigation rate will be as configured with [UBX-CFG-RATE](#). However, (in [protocol versions 18+](#)) the measurement and navigation rate will be as configured with [UBX-CFG-RATE](#) in all active states.

12.7 Power Mode Setup

(Not supported in [protocol versions less than 18](#)).

In order to simplify the power saving configuration of the receiver in typical circumstances, a set of predefined setups can be selected using the message [UBX-CFG-PMS](#).

Selecting one of the available setups (listed below) is the equivalent of using a combination of the configuration messages with appropriate parameters that impact the power consumption of the receiver.

Valid Power Mode Setup in UBX-CFG-PMS

| Setup Name | Description |
|--------------------|---|
| Full Power | No compromises on power saves |
| Balanced (default) | Power savings without performance degradation |
| Aggressive 1Hz | Best power saving setup (1Hz rate) |
| Aggressive 2Hz | Excellent power saving setup (2Hz rate) |
| Aggressive 4Hz | Good power saving setup (4Hz rate) |
| Interval | ON OFF mode setup |

u-blox recommends using these predefined settings, except where users have very specific power saving requirements.

Note that polling UBX-CFG-PMS will return the setup only if the full configuration is consistent with one of the predefined Power Mode Setups.

In 4Hz mode, when running a flash firmware, it is recommended to run with a subset of GNSS systems, to avoid system overload.

13 Forcing a Receiver Reset

Typically, in GNSS receivers, one distinguishes between cold, warm, and hot starts, depending on the type of valid information the receiver has at the time of the restart.

- **Cold start** In cold start mode, the receiver has **no** information from the last position (e.g. time, velocity, frequency etc.) at startup. Therefore, the receiver must search the full time and frequency space, and all possible satellite numbers. If a satellite signal is found, it is tracked to decode the ephemeris (18-36 seconds under strong signal conditions), whereas the other channels continue to search satellites. Once there is a sufficient number of satellites with valid ephemeris, the receiver can calculate position and velocity data. Other GNSS receiver manufacturers call this startup mode **Factory Startup**.
- **Warm start** In warm start mode, the receiver has approximate information for time, position, and coarse satellite position data (Almanac). In this mode, after power-up, the receiver normally needs to download ephemeris before it can calculate position and velocity data. As the ephemeris data usually is outdated after 4 hours, the receiver will typically start with a Warm start if it has been powered down for more than 4 hours. In this scenario, several augmentations are possible. See the section on [Multi-GNSS Assistance](#).
- **Hot start** In hot start mode, the receiver was powered down only for a short time (4 hours or less), so that its ephemeris is still valid. Since the receiver doesn't need to download ephemeris again, this is the fastest startup method.

In the [UBX-CFG-RST](#) message, one can force the receiver to reset and clear data, in order to see the effects of maintaining/losing such data between restarts. For this, the CFG-RST message offers the navBbrMask field, where hot, warm and cold starts can be initiated, and also other combinations thereof.

Data stored in flash memory is not cleared by any of the options provided by UBX-CFG-RST. So, for example, if valid AssistNow Offline data stored in the flash it is likely to have an impact on a "cold start".

The Reset Type can also be specified. This is not related to GNSS, but to the way the software restarts the system.

- **Hardware Reset** uses the on-chip Watchdog, in order to electrically reset the chip. This is an immediate, asynchronous reset. No Stop events are generated. This is equivalent to pull the Reset signal of the receiver to ground.
- **Controlled Software Reset** terminates all running processes in an orderly manner and, once the system is idle, restarts operation, reloads its configuration and starts to acquire and track GNSS satellites.
- **Controlled Software Reset (GNSS only)** only restarts the GNSS tasks, without reinitializing the full system or reloading any stored configuration.
- **Controlled GNSS Stop** stops all GNSS tasks. The receiver will not be restarted, but will stop any GNSS related processing.
- **Controlled GNSS Start** starts all GNSS tasks.

14 Receiver Status Monitoring

Messages in the UBX class [MON](#) are used to report the status of the parts of the embedded computer system that are not GNSS specific.

The main purposes are

- Hardware and Software Versions, using [MON-VER](#). See also the chapter [decoding the output of UBX-MON-VER](#)
- Status of the Communications Input/Output system
- Status of various Hardware Sections with [MON-HW](#)

14.1 Input/Output system

The I/O system is a GNSS-internal layer where all data input- and output capabilities (such as UART, DDC, SPI, USB) of the GNSS receiver are combined. Each communications task has buffers assigned, where data is queued. For data originating at the receiver, to be communicated over one or multiple communications queues, the message [MON-TXBUF](#) can be used. This message shows the current and maximum buffer usage, as well as error conditions.

If the amount of data configured is too much for a certain port's bandwidth (e.g. all UBX messages output on a UART port with a baud rate of 9600), the buffer will fill up. Once the buffer space is exceeded, new messages to be sent will be dropped. For details see section [Serial Communication Ports Description](#)

Inbound data to the GNSS receiver is placed in buffers. Usage of these buffers is shown with the message [MON-RXBUF](#). Further, as data is then decoded within the receiver (e.g. to separate UBX and NMEA data), the [MON-MSGPP](#) can be used. This message shows (for each port and protocol) how many messages were successfully received. It also shows (for each port) how many bytes were discarded because they were not in any of the supported protocol framings.

The following table shows the port numbers used. Note that any numbers not listed are reserved for future use.

Port Number assignment

| Port # | Electrical Interface |
|--------|-----------------------------------|
| 0 | DDC (I ² C compatible) |
| 1 | UART 1 |
| 3 | USB |
| 4 | SPI |

Protocol numbers range from 0-7. All numbers not listed are reserved.

Protocol Number assignment

| Protocol # | Protocol Name |
|------------|---------------|
| 0 | UBX Protocol |
| 1 | NMEA Protocol |
| 2 | RTCM Protocol |

14.2 Jamming/Interference Indicator

The field `jamInd` of the [UBX-MON-HW](#) message can be used as an indicator for continuous wave (narrowband) jammers/interference only. The interpretation of the value depends on the application. It is necessary to run the receiver in an unjammed environment to determine an appropriate value for the unjammed case. If the value rises significantly above this threshold, this indicates that a continuous wave jammer is present.

This indicator is always enabled.

The indicator is reporting any currently detected narrowband interference over all currently configured signal bands

14.3 Jamming/Interference Monitor (ITFM)

The field `jammingState` of the [MON-HW](#) message can be used as an indicator for both broadband and continuous wave (CW) jammers/interference. It is independent of the (CW only) jamming indicator described in [Jamming/Interference Indicator](#) above.

This monitor reports whether jamming has been detected or suspected by the receiver. The receiver monitors the background noise and looks for significant changes. Normally, with no interference detected, it will report 'OK'. If the receiver detects that the noise has risen above a preset threshold, the receiver reports 'Warning'. If in addition, there is no current valid fix, the receiver reports 'Critical'.

The monitor has four states as shown in the following table:

Jamming/Interference monitor reported states

| Value | Reported state | Description |
|-------|----------------|--|
| 0 | Unknown | Jamming/interference monitor not enabled, uninitialized or antenna disconnected |
| 1 | OK | no interference detected |
| 2 | Warning | position ok but interference is visible (above the thresholds) |
| 3 | Critical | no reliable position fix and interference is visible (above the thresholds); interference is probable reason why there is no fix |

The monitor is disabled by default. The monitor is enabled by sending an appropriate [UBX-CFG-ITFM](#) message with the `enable` bit set. In this message it is also possible to specify the thresholds at which broadband and CW jamming are reported. These thresholds should be interpreted as the dB level above 'normal'. It is also possible to specify whether the receiver expects an active or passive antenna.

 *The monitor algorithm relies on comparing the currently measured spectrum with a reference from when a good fix was obtained. Thus the monitor will only function when the receiver has had at least one (good) first fix, and will report 'Unknown' before this time.*

 *Jamming/Interference monitor is not supported in Power Save Mode (PSM) ON/OFF mode.*

The monitor is reporting any currently detected interference over all currently configured signal bands

15 Spoofing Detection

(Note: this feature is not supported in [protocol versions less than 18](#)).

15.1 Introduction

Spoofing is the process whereby someone tries to forge a GNSS signal with the intention of fooling the receiver into calculating a different user position than the true one.

The spoofing detection feature monitors the GNSS signals for suspicious patterns indicating that the receiver is being spoofed. A flag in [UBX-NAV-STATUS](#) alerts the user to potential spoofing.

15.2 Scope

The spoofing detection feature monitors suspicious *changes* in the GNSS signal indicating external manipulation. Therefore the detection is only successful when the signal is genuine first and when the transition to the spoofed signal is being observed directly. When a receiver is started up to a spoofed signal the detection algorithms will be unable to recognize the spoofing. Also, the algorithms rely on availability of signals from multiple GNSS; the detection does not work in single GNSS mode.

16 Signal Attenuation Compensation

(not supported in [protocol versions less than 19](#)).

In normal operating conditions, low signal strength indicates likely contamination by multipath. The receiver trusts such signals less in order to preserve the quality of the position solution in poor signal environments. This feature can result in degraded performance in situations where the signals are attenuated for another reason, for example due to antenna placement. In this case, the signal attenuation compensation feature can be used to restore normal performance.

There are three possible modes:

- Disabled: no signal attenuation compensation is performed
- Automatic: the receiver automatically estimates and compensates for the signal attenuation
- Configured: the receiver compensates for the signal attenuation based on a configured value

These modes can be selected using [UBX-CFG-NAVX5](#). In the case of the "configured" mode, the user should input the maximum C/N0 observed in a clear-sky environment, excluding any outliers or unusually high values. The configured value can have a large impact on the receiver performance, so should be chosen carefully.

17 Remote Inventory

17.1 Description

The *Remote Inventory* enables storing user-defined data in the non-volatile memory of the receiver. The data can be either binary or a string of ASCII characters. In the second case, it will be output at startup after the boot screen.

17.2 Usage

- The contents of the *Remote Inventory* can be set and polled with the message [UBX-CFG-RINV](#). Refer to the message specification for a detailed description.
- If the contents of the *Remote Inventory* are polled without having been set before, the default configuration (see table below) is output.

Default configuration

| Parameter | Value |
|-----------|--------------------------|
| flags | 0x00 |
| data | "Notice: no data saved!" |

As with all configuration changes, these must be saved in order to be made permanent. Make sure to save the section RINV before resetting or switching off the receiver. For more information about saving a configuration, see section [Configuration Concept](#).

18 Time pulse

For protocol versions less than 18, functionality of the time pulse has not been characterized when only BeiDou is enabled.

The time pulse feature is not available for protocol versions 23-23.01.

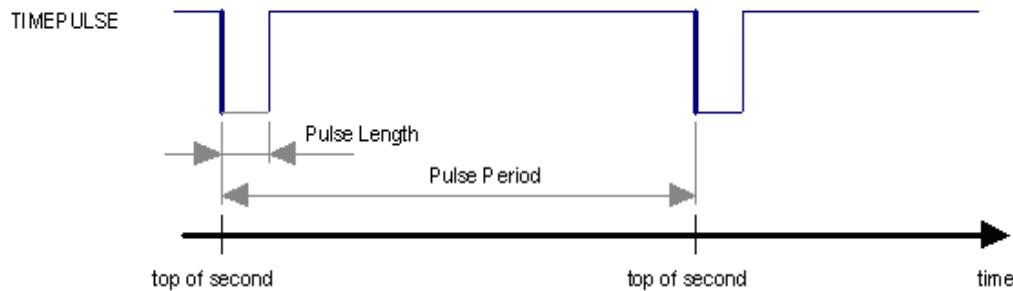

18.1 Introduction

u-blox receivers include a time pulse function providing clock pulses with configurable duration and frequency. The time pulse function can be configured using the [UBX-CFG-TP5](#) message. The [UBX-TIM-TP](#) message provides time information for the next pulse, time source and the quantization error of the output pin.

Pulse Mode: Rising

Pulse Mode: Falling

18.2 Recommendations

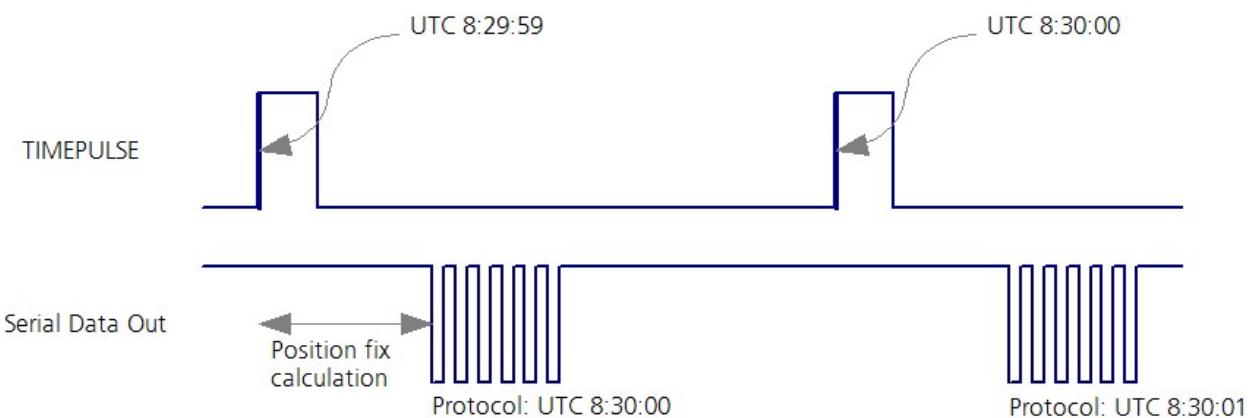

- The time pulse can be aligned to a wide variety of GNSS times or to variants of UTC derived from them (see the section on [time bases](#)). However, it is strongly recommended that the choice of time base is aligned with the available GNSS signals (so to produce GPS time or UTC(USNO), ensure GPS signals are available, and for GLONASS time or UTC(SU) ensure the presence GLONASS signals). This will involve coordinating that the setting of [UBX-CFG-GNSS](#) with the choice of time pulse time base.
- For best time pulse performance it is recommended to disable the SBAS subsystem.
- When using time pulse for precision timing applications it is recommended to calibrate the antenna cable delay against a reference-timing source.
- Care needs to be given to the cable delay settings in the receiver configuration.

- In order to get the best timing accuracy with the antenna, a fixed and accurate position is needed.
- If relative time accuracy between multiple receivers is required, do not mix receivers of different product families. If this is required, the receivers must be calibrated accordingly, by setting cable delay and user delay.
- The recommended configuration when using the [UBX-TIM-TP](#) message is to set both the measurement rate ([UBX-CFG-RATE](#)) and the time pulse frequency ([UBX-CFG-TP5](#)) to 1Hz.

Since the rate of [UBX-TIM-TP](#) is bound to the measurement rate, more than one [UBX-TIM-TP](#) message can appear between two pulses if the measurement rate is set larger than the time pulse frequency. In this case all [UBX-TIM-TP](#) messages in between a time pulse T1 and T2 belong to T2 and the last [UBX-TIM-TP](#) before T2 reports the most accurate quantization error. In general, if the navigation solution rate and time pulse rate are configured to different values, there will not be a single [UBX-TIM-TP](#) message for each time pulse.

The sequential order of the signal present at the TIMEPULSE pin and the respective output message for the simple case of 1 pulse per second (1PPS) and a one second navigation update rate is shown in the following figure.

18.3 GNSS time bases

GNSS receivers must handle a variety of different time bases as each GNSS has its own reference system time. What is more, although each GNSS provides a model for converting their system time into UTC, they all support a slightly different variant of UTC. So, for example, GPS supports a variant of UTC as defined by the US National Observatory, while BeiDou uses UTC from the National Time Service Center, China (NTSC). While the different UTC variants are normally closely aligned, they can differ by as much as a few hundreds of nanoseconds.

Although u-blox receivers can combine a variety of different GNSS times internally, the user must choose a single type of GNSS time and, separately, a single type of UTC for input (on EXTINTs) and output (via the Time Pulse) and the parameters reported in corresponding messages.

For [protocol versions 16 or greater](#), the [UBX-CFG-TP5](#) message allows the user to choose between any of the supported GNSS (GPS, GLONASS, BeiDou, etc) times and UTC. Also, the [UBX-CFG-NAV5](#) message allows the user to select which variant of UTC the receiver should use. This includes an "automatic" option which causes the receiver to select an appropriate UTC version itself, based on the [GNSS configuration](#), using, in order of preference, USNO if GPS is enabled, SU if GLONASS is enabled, NTSC if BeiDou is enabled and, finally, European if Galileo is enabled.

Note that for [protocol versions prior to 16](#), no choice of UTC variant is supported and the [UBX-CFG-TP5](#) message only allows the user to choose between GPS and UTC as the time system the generated time pulse will be aligned to.

The receiver will assume that the input time pulse uses the same GNSS time base as specified for the output using [UBX-CFG-TP5](#). So if the user selects GLONASS time for time pulse output, any time pulse input must also be aligned to GLONASS time (or to the separately chosen variant of UTC). Where UTC is selected for time pulse output, any GNSS time pulse input will be assumed to be aligned to GPS time.

 *u-blox receivers allow users to choose independently GNSS signals used in the receiver (using [UBX-CFG-GNSS](#)) and the input/output time base (using [UBX-CFG-TP5](#)). For example it is possible to instruct the receiver to use GPS and GLONASS satellite signals to generate BeiDou time. This practice will compromise time-pulse accuracy if the receiver cannot measure the timing difference between the constellations directly and is not recommended.*

 *The information that allows GNSS times to be converted to the associated UTC times is only transmitted by the GNSS at relatively infrequent periods. For example GPS transmits UTC(USNO) information only once every 12.5 minutes. Therefore, if a Time Pulse is configured to use a variant of UTC time, after a cold start, substantial delays before the receiver has sufficient information to start outputting the Time Pulse can be expected.*

18.4 Time pulse configuration

u-blox receivers provide one or two TIMEPULSE pins (dependent on product variant) delivering a time pulse (TP) signal with a configurable pulse period, pulse length and polarity (rising or falling edge). Check the product data sheet for detailed specification of configurable values.

It is possible to define different signal behavior (i.e. output frequency and pulse length) depending on whether or not the receiver is locked to a reliable time source. Time pulse signals can be configured using the UBX proprietary message [UBX-CFG-TP5](#).

18.5 Configuring time pulse with UBX-CFG-TP5

The UBX message [UBX-CFG-TP5](#) can be used to change the time pulse settings, and includes the following parameters defining the pulse:

- **time pulse index** - Index of time pulse output pin to be configured. If a product only has one time pulse output it is typically configurable with index 0. Exceptions to this include LEA-M8F, M8030-KT-FT and NEO-M8L. Please refer to specific product documentation.
- **antenna cable delay** - Signal delay due to the cable between antenna and receiver.
- **RF group delay** - Signal delay in the RF module of the receiver (read-only).
- **pulse frequency/period** - Frequency or period time of the pulse when locked mode is not configured or active.
- **pulse frequency/period lock** - Frequency or period time of the pulse, as soon as receiver has calculated a valid time from a received signal. Only used if the corresponding flag is set to use another setting in locked mode.
- **pulse length/ratio** - Length or duty cycle of the generated pulse, either specifies a time or ratio for the pulse to be on/off.
- **pulse length/ratio lock** - Length or duty cycle of the generated pulse, as soon as receiver has calculated a valid time from a received signal. Only used if the corresponding flag is set to use another setting in locked mode.
- **user delay** - The cable delay from the receiver to the user device plus signal delay of any user application.
- **active** - time pulse will be active if this bit is set.
- **lock to gps freq** - Use frequency gained from GPS signal information rather than local oscillator's frequency

if flag is set.

- **lock to gnss freq** - Use frequency gained from GNSS signal information rather than local oscillator's frequency if flag is set.
- **locked other setting** - If this bit is set, as soon as the receiver can calculate a valid time, the alternative setting is used. This mode can be used for example to disable time pulse if time is not locked, or indicate lock with different duty cycles.
- **is frequency** - Interpret the 'Frequency/Period' field as frequency rather than period if flag is set.
- **is length** - Interpret the 'Length/Ratio' field as length rather than ratio if flag is set.
- **align to TOW** - If this bit is set, pulses are aligned to the top of a second.
- **polarity** - If set, the first edge of the pulse is a rising edge (Pulse Mode: Rising).
- **grid UTC/GPS** - Selection between UTC (0) or GPS (1) timegrid. Also effects the time output by [UBX-TIM-TP](#) message.
- **grid UTC/GNSS** - Selection between UTC (0), GPS (1), GLONASS (2) and Beidou (3) timegrid. Also effects the time output by [UBX-TIM-TP](#) message.

The maximum pulse length can't exceed the pulse period.

Time pulse settings shall be chosen in such a way, that neither the high nor the low period of the output is less than 50 ns (except when disabling it completely), otherwise pulses can be lost.

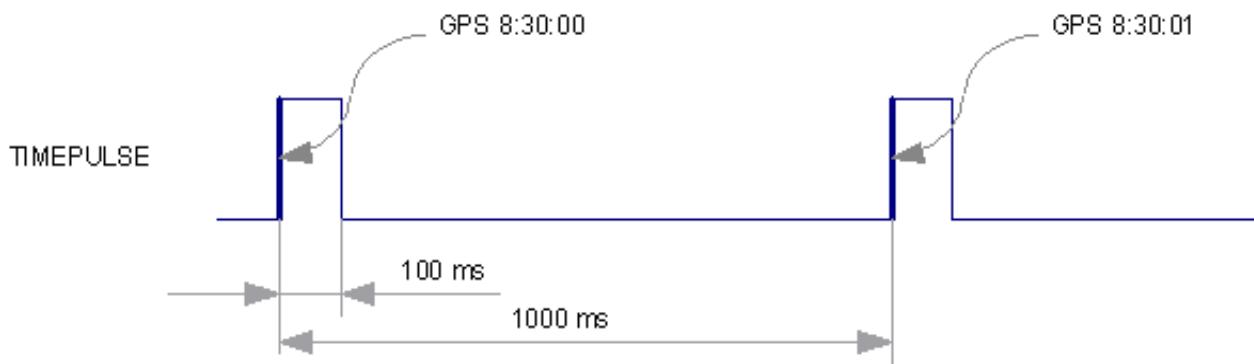

The maximum frequency of the second time pulse pin (TIMEPULSE2) is limited to 1kHz for protocol versions less than 18 unless using a Timing product variant.

18.5.1 Example 1

The example below shows the 1PPS TP signal generated on the time pulse output according to the specific parameters of the [UBX-CFG-TP5](#) message:

- **tplIdx** = 0
- **freqPeriod** = 1 s
- **pulseLenRatio** = 100 ms
- **active** = 1
- **lockGpsFreq** = **lockGnssFreq** = 1
- **isLength** = 1
- **alignToTow** = 1
- **polarity** = 1
- **gridUtcGps** = **gridUtcGnss** = 1

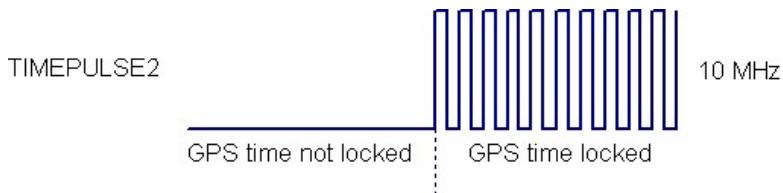

The 1 Hz output is maintained whether or not the receiver is locked to GPS time. The alignment to TOW can only be maintained when GPS time is locked.

18.5.2 Example 2

This example only works with a Timing product variant or for [protocol versions greater than 17](#).

The following example shows a 10 MHz TP signal generated on the TIMEPULSE2 output when the receiver is locked to GPS time. Without the lock to GPS time no frequency is output.

- **tpIdx** = 1
- **freqPeriod** = 1 Hz
- **pulseLenRatio** = 0
- **freqPeriodLock** = 10 MHz
- **pulseLenRatioLock** = 50%
- **active** = 1
- **lockGpsFreq** = **lockGnssFreq** = 1
- **lockedOtherSet** = 1
- **isFreq** = 1
- **alignToTow** = 1
- **polarity** = 1
- **gridUtcGps** = **gridUtcGnss** = 1

19 Timemark

The receiver can be used to provide an accurate measurement of the time at which a pulse was detected on the external interrupt pin. The reference time can be chosen by setting the time source parameter to UTC, GPS, GLONASS, BeiDou, Galileo or local time in the [UBX-CFG-TP5](#) configuration message. The UTC standard can be set in the [UBX-CFG-NAV5](#) configuration message. The delay figures defined with [UBX-CFG-TP5](#) are also applied to the results output in the [UBX-TIM-TM2](#) message.

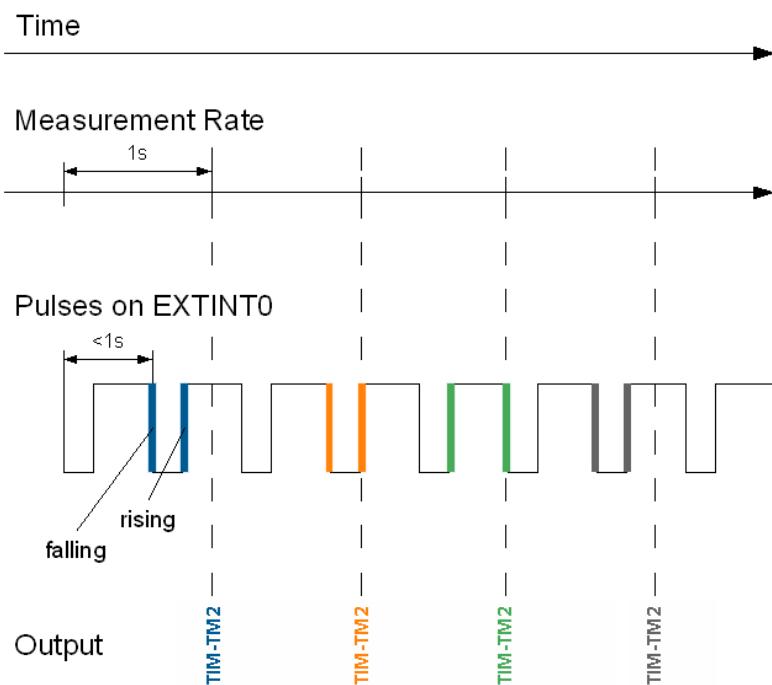

A [UBX-TIM-TM2](#) message is output at the next epoch if

- the [UBX-TIM-TM2](#) message is enabled
- a rising or falling edge was triggered since last epoch on one of the EXTINT channels

The [UBX-TIM-TM2](#) messages include time of the last timemark, new rising/falling edge indicator, time source, validity, number of marks and a quantization error. The timemark is triggered continuously.

Only the last rising and falling edge detected between two epochs is reported since the output rate of the [UBX-TIM-TM2](#) message corresponds to the measurement rate configured with [UBX-CFG-RATE](#) (see Figure below).

20 Odometer

20.1 Introduction

The odometer provides information on travelled ground distance (in meter) using solely the position and Doppler-based velocity of the navigation solution. For each computed travelled distance since the last odometer reset, the odometer estimates a 1-sigma accuracy value. The total cumulative ground distance is maintained and saved in the BBR memory.

The odometer feature is disabled by default. It can be enabled using the [UBX-CFG-ODO](#) message.

20.2 Odometer Output

The odometer output is published in the [UBX-NAV-ODO](#) message. This message contains the following elements:

- *Ground distance since last reset* (*distance* field): this distance is defined as the total cumulated distance in meters since the last time the odometer was reset (see section [Resetting the Odometer](#));
- *Ground distance accuracy* (*distanceStd* field): this quantity is defined as the 1-sigma accuracy estimate (in meters) associated to the *Ground distance since last reset* value;
- *Total cumulative ground distance* (*totalDistance* field): this quantity is defined as the total cumulated distance

in meters since the last time the receiver was cold started (see section [Resetting the Odometer](#)).

If logging is enabled, then the odometer's *ground distance since last reset* value will be included in the logged position data (see section [Logging](#)).

20.3 Odometer Configuration

The odometer can be enabled/disabled by setting the appropriate flag in [UBX-CFG-ODO](#) (*flags* field). The algorithm behaviour can be optimized by setting up a profile (*odoCfg* field) representative of the context in which the receiver is operated. The implemented profiles together with their meanings are listed below:

- *Running*: the algorithm is optimized for typical dynamics encountered while running, i.e the Doppler-based velocity solution is assumed to be of lower quality;
- *Cycling*: the algorithm is optimized for typical dynamics encountered while cycling;
- *Swimming*: the algorithm is optimized for very slow and smooth trajectories typically encountered while swimming;
- *Car*: the algorithm assumes that good Doppler measurements are available (i.e. the antenna is subject to low vibrations) and is optimized for typical dynamics encountered by cars.

The odometer can only be reliably operated in a swimming context if satellite signals are available and the antenna is not immersed.

20.4 Resetting the Odometer

The odometer outputs (see [UBX-NAV-ODO](#) message) can be reset by the following means:

- *Ground distance since last reset* (*distance* field): by sending a [UBX-NAV-RESETODO](#) message;
- *Ground distance accuracy* (*distanceStd* field): by sending a [UBX-NAV-RESETODO](#) message;
- *Total cumulative ground distance* (*totalDistance*): by a cold start of the receiver (this erases the BBR memory);

21 Logging

21.1 Introduction

The logging feature allows position fixes and arbitrary byte strings from the host to be logged in flash memory attached to the receiver. Logging of position fixes happens independently of the host system, and can continue while the host is powered down.

The following tables list all the logging related messages:

Logging control and configuration messages

| Message | Description |
|-----------------------------------|--|
| UBX-LOG-CREATE | Creates a log file and activates the logging subsystem |
| UBX-LOG-ERASE | Erases a log file and deactivates the logging subsystem |
| UBX-CFG-LOGFILTER | Used to start/stop recording and set/get the logging configuration |
| UBX-LOG-INFO | Provides information about the logging system |
| UBX-LOG-STRING | Enables a host process to write a string of bytes to the log file |

Logging retrieval messages

| Message | Description |
|-------------------------------------|---|
| UBX-LOG-RETRIEVE | Starts the log retrieval process |
| UBX-LOG-RETRIEVEPOS | A position log entry returned by the receiver |

Logging retrieval messages continued

| Message | Description |
|--|--|
| UBX-LOG-RETRIEVEPOSEXT | Odometer position data |
| RA | |
| UBX-LOG-RETRIEVESTRING | A byte string log entry returned by the receiver |
| UBX-LOG-FINDTIME | Finds the index of the first entry <= given time |

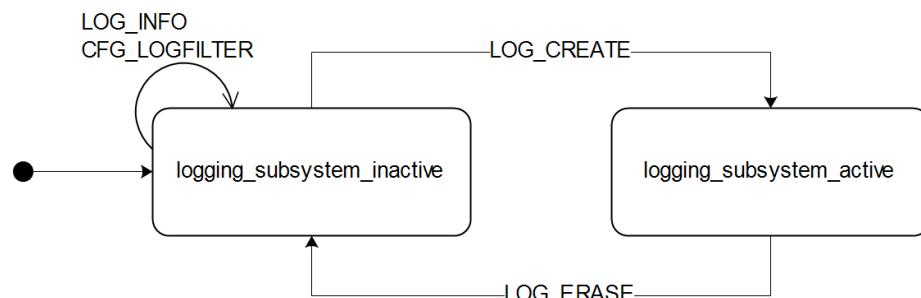

21.2 Setting the logging system up

An empty log can be created using the [UBX-LOG-CREATE](#) message and a log can be deleted with the [UBX-LOG-ERASE](#) message. The logging system will only be running if a log is in existence, so most logging messages will be rejected with an [UBX-ACK-NAK](#) message if there is no log present. Only one log can be created at any one time so an [UBX-ACK-NAK](#) message will be returned if a log already exists. The message specifies the maximum size of the log in bytes (with some pre-set values provided). Both the logging subsystem and the receiver file-store have implementation overheads, so total space available for log entries will be somewhat smaller than the size specified.

[UBX-LOG-CREATE](#) also allows the log to be specified as a circular log. If the log is circular, then when it fills up, a set of older log entries will be deleted and the space freed up used for new log entries. By contrast, if a non-circular log becomes full then new entries which don't fit will be rejected. [UBX-LOG-CREATE](#) also causes the logging system to start up so that further logging messages can be processed. The logging system will start up automatically on power-up if there is a log in existence. The log will remain in the receiver until specifically erased using the [UBX-LOG-ERASE](#) message.

[UBX-CFG-LOGFILTER](#) controls whether logging of entries is currently enabled and selects position fix messages for logging. These configuration settings will be saved if the configuration is saved to flash. If this is done, then entry logging will continue on power-up in the same manner that it did before power-down.

The top level active/inactive states of the logging subsystem.

21.3 Information about the log

The receiver can be polled for a [UBX-LOG-INFO](#) message which will give information about the log. This will include the maximum size that the log can grow to (which, due to overheads, will be smaller than that requested in [UBX-LOG-CREATE](#)) and the amount of log space currently occupied. It will also report the number of entries currently in the log together with the time and date of the newest and oldest messages which have a valid time stamp.

Log entries are compressed and have housekeeping information associated with them, so the actual space occupied by log messages may be difficult to predict. The minimum size for a position fix entry is 9 bytes and the maximum 24 bytes, the typical size is 10 or 11 bytes. If the odometer is enabled then this will use at least another three bytes per fix.

Each log also has a fixed overhead which is dependent on the log type. The approximate size of this overhead is

shown in the following table.

Log overhead size

| Log type | Overhead |
|--------------|-------------|
| circular | Up to 40 kB |
| non-circular | Up to 8 kB |

The number of entries that can be logged in any given flash size can be estimated as follows:

Approx. number of entries = (flash size available for logging - log overhead)/typical entry size

For example, if 1500 kB of flash is available for logging (after other flash usage such as the firmware image is taken into account) a non-circular log would be able to contain approximately 139000 entries
 $((1500*1024)-(8*1024))/11 = 138891$.

21.4 Recording

The [UBX-CFG-LOGFILTER](#) message specifies the conditions under which entries are recorded. Nothing will be recorded if recording is disabled, otherwise position fix and [UBX-LOG-STRING](#) entries can be recorded. When recording is enabled an entry will also be created from each [UBX-LOG-STRING](#) message. These will be timestamped if the receiver has current knowledge of time.

The [UBX-CFG-LOGFILTER](#) message has several values which can be used to select position fix entries for logging. If all of these values are zero, then all position fixes will be logged (subject to a maximum rate of 1Hz). A position is logged if any of the thresholds are exceeded. If a threshold is set to zero it is ignored. In addition the position difference and current speed thresholds also have a minimum time threshold.

Position fixes are only recorded if a valid fix is obtained - failed and invalid fixes are not recorded.

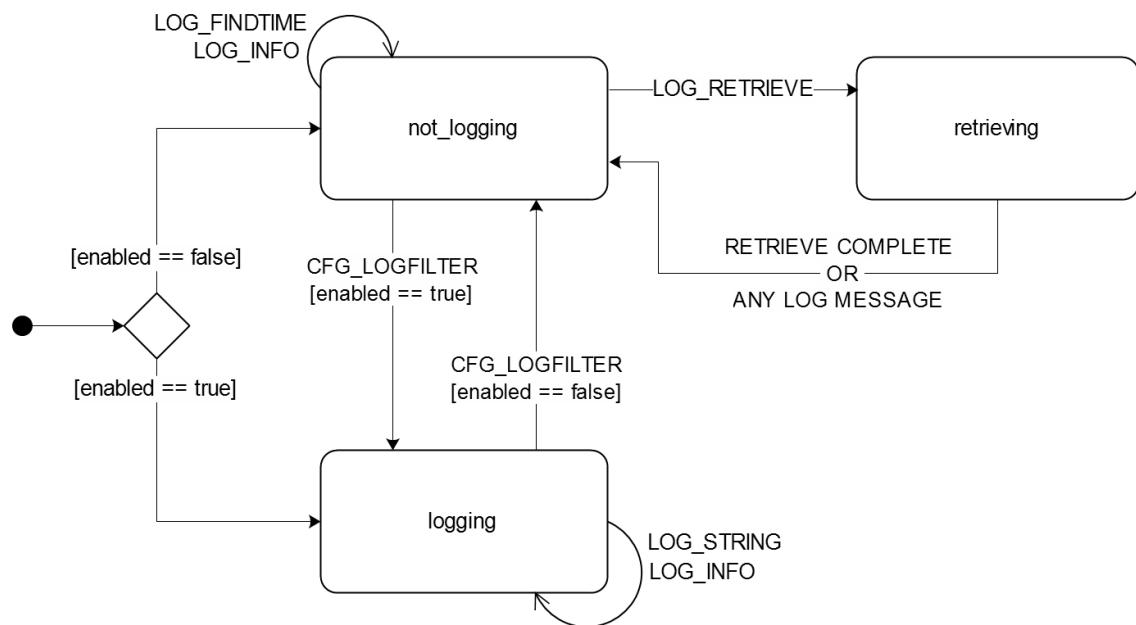

Position fixes are compressed to economise on the amount of flash space used. In order to improve the compression, the fix values are rounded to improve their compression. This means that the values returned by the logging system may differ slightly from any which are gathered in real time.

In [On/Off Power Save Mode](#) it is possible to configure the logging system so that only one fix is recorded for each on period. This will be recorded immediately before the receiver powers off and will be the best fix seen during the on period (in this case, "best" is defined as being the fix with the lowest horizontal accuracy figure).

The recorded data for a fix comprises :

- The time and date of the fix recorded to a precision of one second
- Latitude and longitude to a precision of one millionth of a degree. Depending on position on Earth this is a precision in the order of 0.1m
- Altitude (height above mean sea level) to a precision of 1m
- Ground speed to a precision of 1cm/s
- The fix type (only successful fix types, since these are the only ones recorded)
- The number of satellites used in the fix is recorded, but no value greater than 19 is logged; a value of 19 means 19 or more satellites
- A horizontal accuracy estimate is recorded to give an indication of fix quality
- Heading to a precision of one degree
- Odometer distance data (if odometer is enabled)

The states of the active logging subsystem

21.5 Retrieval

[UBX-LOG-RETRIEVE](#) starts the process which allows the receiver to output log entries. Log recording must be stopped using [UBX-CFG-LOGFILTER](#) before this can be done. [UBX-LOG-INFO](#) may be helpful to a host system in order to understand the current log status before retrieval is started.

Once retrieval has started, one message will be output from the receiver for each log entry requested. Sending any logging message to the receiver during retrieval will cause the retrieval to stop before the message is processed.

To maximise the speed of transfer it is recommended that a high communications data rate is used and GNSS processing is stopped during the transfer (see [UBX-CFG-RST](#))

[UBX-LOG-RETRIEVE](#) can specify a start-entry index and entry-count. The maximum number of entries that can be returned in response to a single [UBX-LOG-RETRIEVE](#) message is 256. If more entries than this are required the message will need to be sent multiple times with different startEntry indices.

The receiver will send a [UBX-LOG-RETRIEVEPOS](#) message for each position fix log entry and a [UBX-LOG-RETRIEVESTRING](#) message for each string log entry. If the odometer was enabled at the time a position was logged, then a [UBX-LOG-RETRIEVEPOSEXTRA](#) will also be sent. Messages will be sent in the order in which they were logged, so [UBX-LOG-RETRIEVEPOS](#) and [UBX-LOG-RETRIEVESTRING](#) messages may be interspersed in the message stream.

The [UBX-LOG-FINDTIME](#) message can be used to search a log for the index of the first entry less than or equal to the given time. This index can then be used with the [UBX-LOG-RETRIEVE](#) message to provide time-based retrieval of log entries.

21.6 Command message acknowledgement

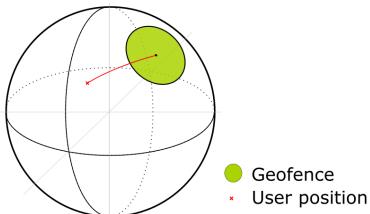

Some log operations may take a long time to execute because of the time taken to write to flash memory. The time for some operations may be unpredictable since the number and timing of flash operations may vary. In order to allow host software to synchronise to these delays logging messages will always produce a response. This will be [UBX-ACK-NAK](#) in case of error, otherwise [UBX-ACK-ACK](#) unless there is some other defined response to the message.

It is possible to send a small number of logging commands without waiting for acknowledgement, since there is a command queue, but this risks confusion between the acknowledgements for the commands. Also a command queue overflow would result in commands being lost.

22 Geofencing

(Note: this feature is not supported in [protocol versions less than 18](#)).

22.1 Introduction

The geofencing feature allows for the configuration of up to four circular areas (geofences) on the Earth's surface. The receiver will then evaluate for each of these areas whether the current position lies within the area or not and signal the state via UBX messaging and PIO toggling.

22.2 Interface

Geofencing can be configured using the [UBX-CFG-GEOFENCE](#) message. The geofence evaluation is active whenever there is at least one geofence configured.

The current state of each geofence plus the combined state is output in [UBX-NAV-GEOFENCE](#) with every navigation epoch.

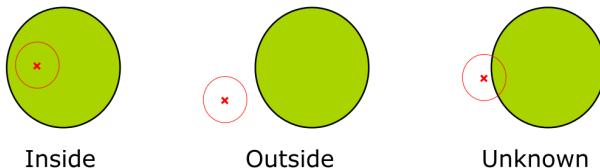

Additionally the user can configure the receiver to output the combined geofence state on a physical pin.

22.3 Geofence state evaluation

With every navigation epoch the receiver will evaluate the current solution's position versus the configured geofences. There are three possible outcomes for each geofence:

- *Inside* - The position is inside the geofence with the configured confidence level
- *Outside* - The position lies outside of the geofence with the configured confidence level
- *Unknown* - There is no valid position solution or the position uncertainty does not allow for unambiguous state evaluation

The position solution uncertainty (standard deviation) is multiplied with the configured confidence sigma level number and taken into account when evaluating the geofence state (red circle in figure below).

The combined state for all geofences is evaluated as the combination (logical OR) of all geofences:

- *Inside* - The position lies inside of at least one geofence
- *Outside* - The position lies outside of all geofences
- *Unknown* - All remaining states

22.4 Using a PIO for Geofence State Output

This feature can be used for example for waking up a sleeping host when a defined geofence condition is reached. The receiver will toggle the assigned pin according to the *combined* geofence state. Due to hardware restrictions the unknown state will always be represented as HIGH. If the receiver is in software backup or in a reset, the pin will go to HIGH accordingly. The meaning of the LOW state can be configured using [UBX-CFG-GEOFENCE](#).

23 Host Interface Signature Description

23.1 Introduction

The host interface signature feature is designed to help to detect 3rd party attempts to tamper with position and/or time in the host communication channel (i.e. UART).

The level of security of such mechanism depends on how the final system is designed. The feature itself cannot guarantee that the system is secure if the host, the final system HW, and the production setup are not secure.

The feature works by the receiver calculating a numerical signature for the configured messages. The system receiving the message can verify the signature based on the message content and the configured value, termed "seed".

Two new messages are provided for configuring the seed used for the signing: [UBX-CFG-FIXSEED](#) and [UBX-CFG-DYNSEED](#).

23.2 Configuring the Fixed Seed and Register Messages

In the [UBX-CFG-FIXSEED](#) message the fixed seed and the set of UBX messages to be signed can be configured.

At least one message has to be registered and a maximum of 10 messages are supported.

Configuring the set of messages that are signed will not enable these messages by default.

All UBX messages can be signed.

This message can only be sent once to the receiver. All subsequent messages will result in a NAK answer.

23.3 Configuring the Dynamic Seed

In the [UBX-CFG-DYNSEED](#) message an additional seed can be configured to make a replay attack more difficult. This form of attack stores the messages received from the receiver for a certain time and replays them later.

To prevent such an attack the host can use the time information from the receiver or a dynamic seed. This generates a random seed at regular intervals that is then used by the receiver to sign the outgoing messages.

The frequency of the update on the dynamic seed has to be configured depending on the security concept of the whole system. In case the interval is too long the attacker can store the first set of messages and replay them during the whole period until a new seed is generated. The recommended interval would be in the range of some seconds to a few minutes.

By default the dynamic seed is set to 0x0000_0000_0000_0000.

While programming the dynamic seed the receiver may send still send signatures which are based on the old seed.

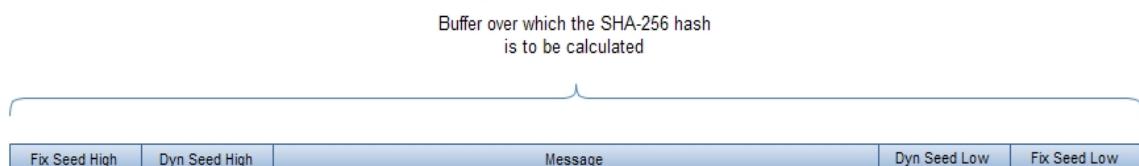

23.4 Parsing the Signature

The [UBX-SEC-SIGN](#) message contains the signature of a previously transmitted message and is **always** sent after the related message. It is not guaranteed that between the message and the signature no other messages are output.

The payload of [UBX-SEC-SIGN](#) contains the reference to the signed message. It can be used to match the related message using the class ID, the message ID and the UBX checksum of the related message. This means that a previously transmitted message is signed when the class ID, the message ID and the UBX checksum match.

23.5 Calculate the Hash

The picture below shows the layout of the buffer over which the SHA-256 hash is calculated.

The result is a 256 bit (32 bytes) hash which needs to be verified with the content (field *hash*) of the corresponding [UBX-SEC-SIGN](#) message.

24 Time Mode Configuration

This feature is only available with Timing, FTS or High Precision GNSS (HPG) products

This section relates to the configuration message [UBX-CFG-TMODE2](#) (for Timing or FTS products) and to the configuration message [UBX-CFG-TMODE3](#) (for HPG products).

24.1 Introduction

Time Mode is a special receiver mode where the position of the receiver is known and fixed and only the time is calculated using all available satellites. This mode allows for maximum time accuracy, for single-SV solutions, and also for using the receiver as a stationary reference station.

24.2 Fixed Position

In order to use the *Time Mode*, the receiver's position must be known as exactly as possible. Either the user already knows and enters the position, or it is determined using [Survey-in](#). Errors in the fixed position will translate into time errors depending on the satellite constellation.

For Timing products, as a rule of thumb the position should be known with an accuracy of better than 1 m for a timing accuracy in the order of nanoseconds. If an accuracy is required only in the order of microseconds, a position accuracy of roughly 300 m is sufficient.

For HPG products, errors in the reference station position will directly translate into rover position errors. The reference station position accuracy should therefore be at least as good as the desired rover absolute position accuracy.

24.3 Survey-in

Survey-in is the procedure that is carried out prior to using *Time Mode*. It determines a stationary receiver's position by building a weighted mean of all valid 3D position solutions.

Two requirements for stopping the procedure must be specified:

- The **minimum observation time** defines a minimum amount of observation time regardless of the actual number of valid fixes that were used for the position calculation. Reasonable values range from one day for high accuracy requirements to a few minutes for coarse position determination.
- The **required 3D position standard deviation** defines a limit on the spread of positions that contribute to the calculated mean. As the position error translates into a time error when using *Time Mode* (see [above](#)), one should carefully evaluate the time accuracy requirements and choose an appropriate value.

Survey-in ends, when **both** requirements are met. After Survey-in has finished successfully, the receiver will automatically enter fixed position *Time Mode*. The Survey-in status can be queried using the [UBX-TIM-SVIN](#) message for Timing or FTS products or the [UBX-NAV-SVIN](#) message for HPG products.

The "Standard Deviation" parameter defines uncertainty of the manually provided "True Position" set of parameters. This uncertainty directly affects the accuracy of the timepulse. This is to prevent an error that would otherwise be present in the timepulse because of the initially inaccurate position (assumed to be correct by the receiver) without users being aware of it. The "3D accuracy" parameter in "Fixed Position" as well as the "Position accuracy limit" in "Survey-in" affect the produced time information and the timepulse in the same way. Please note that the availability of the position accuracy does not mitigate the error in the timepulse but only accounts for it when calculating the resulting time accuracy.

Once a survey-in has been started, its progress is saved in non-volatile memory, and hence continues over events such as a reset, receiver restart, or change of satellite constellation. If a survey-in position is required using data only for a particular receiver configuration, then any on-going survey-in should be stopped by either a [UBX-CFG-TMODE2](#) or a [UBX-CFG-TMODE3](#) message with the timeMode field set to 0, then the receiver configured as required, and then a new [UBX-CFG-TMODE2](#) or [UBX-CFG-TMODE3](#) message sent with the new survey-in parameters.

25 Time & Frequency Sync (FTS)

The features described in this section are only available with the FTS products

25.1 Introduction

An FTS configured receiver provides an accurate, low phase-noise reference frequency as well as phase reference pulse (typically at one pulse per second). An FTS receiver also implements automatic hold-over capability based on a stable VCTCXO in modules and the customer's choice of reference oscillator in chip-based designs. It offers generic interfaces for external sources of synchronization (suitable for external OCXOs, IEEE1588 or Synchronous Ethernet). The receiver is optimized for stationary applications and delivers excellent GNSS sensitivity in conjunction with assistance data.

In the rest of this description the following terminology will be used:

- Disciplined oscillator: an oscillator whose frequency is corrected by a more stable frequency reference, such as a GNSS system.
- Internal oscillator: the mandatory disciplined oscillator which is used as the reference frequency for the GNSS receiver subsystem. The output from this oscillator is also available to the application as an output from the

module.

- External oscillator: an optional oscillator, disciplined by the receiver, either via I2C DAC or via UBX messages handle by a host.
- Source: a source of frequency and/or phase synchronization either measured by the receiver based on direct hardware input or an offset estimated by an external timing sub-system with respect to the receiver output. Sources are handled according to related estimates of uncertainty delivered by the application or (for oscillators) configurable models provided by the receiver.
- Holdover: periods when GNSS measurements of sufficient quality to maintain time/frequency are not available.

In all FTS related messages the above sources are indexed as follows:

Synchronization source indexing

| Source | Index |
|--|-------|
| Internal oscillator | 0 |
| GNSS | 1 |
| EXTINT0 (external input) | 2 |
| EXTINT1 (external input) | 3 |
| Internal oscillator measured by the host | 4 |
| External oscillator measured by the host | 5 |

The following table lists FTS related messages:

FTS message summary

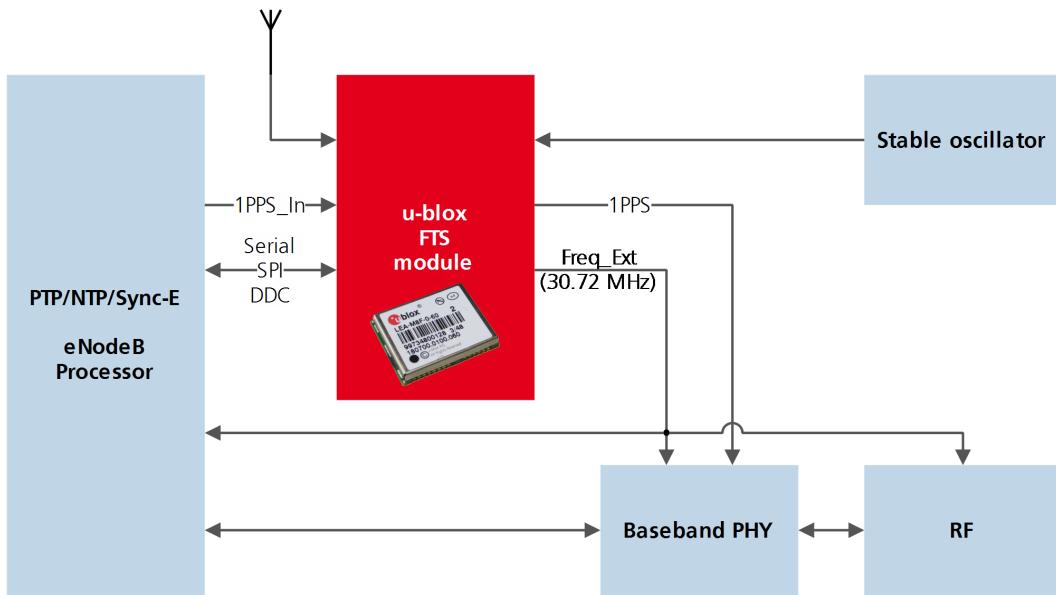

| Message | Description |
|----------------|--|
| UBX-CFG-SMGR | Synchronization manager configuration |
| UBX-CFG-ESRC | External source configuration |
| UBX-CFG-DOSC | Disciplined oscillator configuration |
| UBX-CFG-TP5 | Configures the output pulse parameters |
| UBX-CFG-NAV5 | Configures which variant of UTC is used by the receiver |
| UBX-MON-SMGR | SMGR monitoring message |
| UBX-TIM-DOSC | Message containing disciplining command for external oscillators controlled through the host |
| UBX-TIM-HOC | Message allowing the host to directly control the module's oscillators |
| UBX-TIM-TOS | Message containing information about the preceding time-pulse output by the receiver |
| UBX-TIM-SMEAS | Message containing measurements of phase/frequency inputs |
| UBX-TIM-VCOCAL | Oscillator calibration command and result report |
| UBX-TIM-FCHG | Information about latest frequency change to an oscillator |

The remainder of this chapter describes some typical use cases, introduces the Synchronization Manager (SMGR) functionality unique to FTS products and describes the use of related messages.

25.2 Example use cases

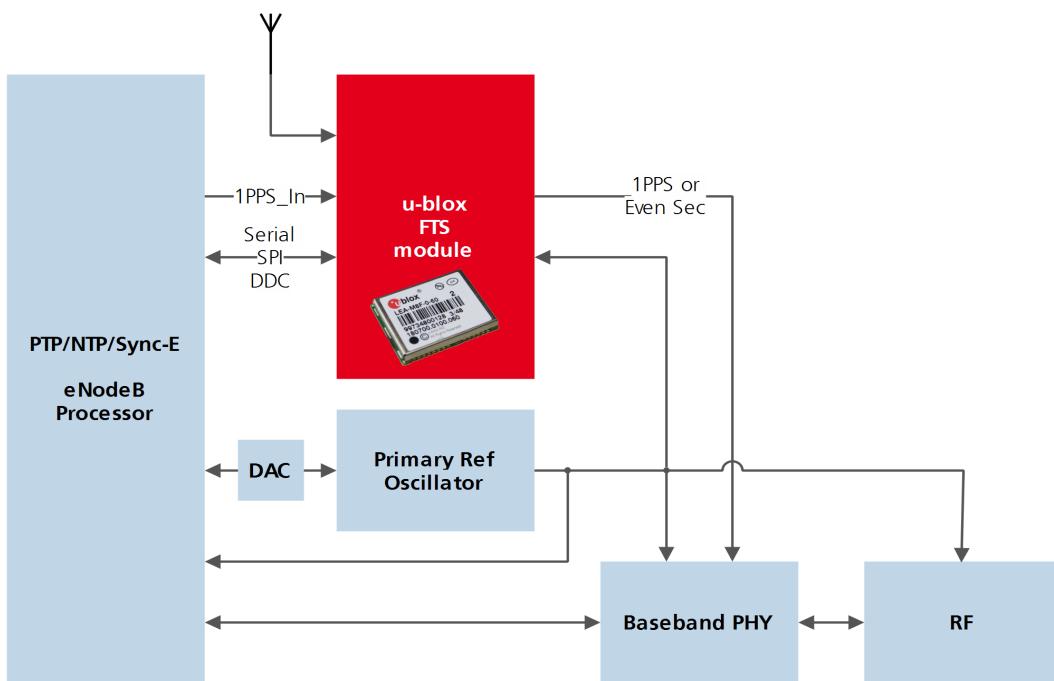

In this section some typical use cases are described.

25.2.1 Stand-alone synchronization system

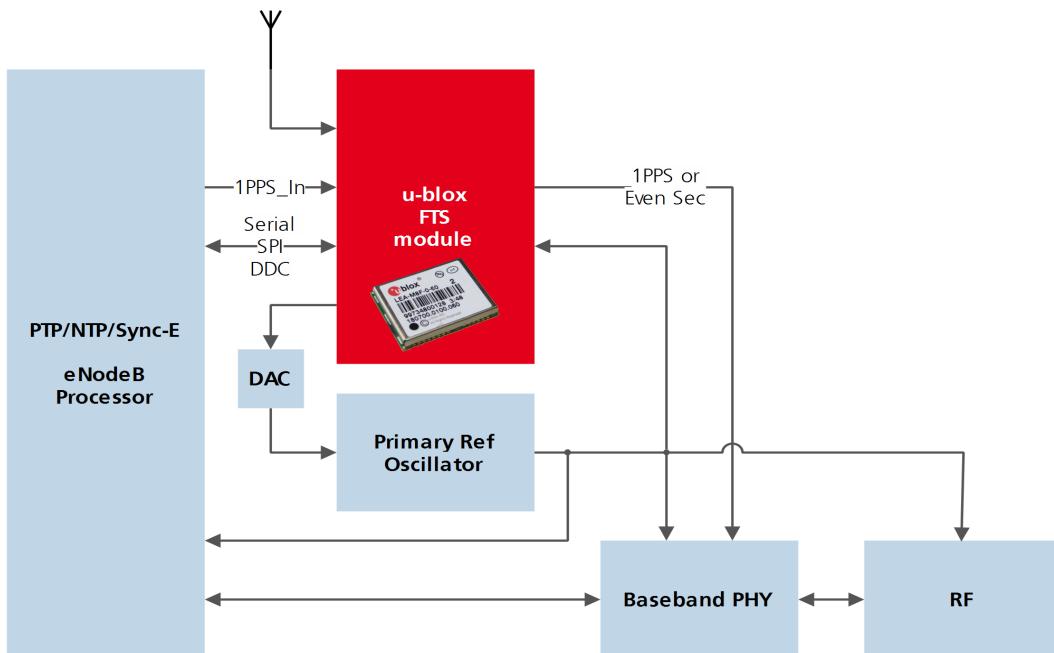

In this example, the FTS device provides a stand-alone synchronization sub-system in the context of, say, a small cell. The module's internal 30.72MHz VCTCXO is disciplined by the module and provides the frequency reference to the platform. The module provides a PPS signal to synchronize the platform's physical layer. A 1PPS (or frequency) input to the module provides frequency and/or phase information from host timing sub-systems such as PTP or Sync-E. In the absence of phase information from GNSS or any other source, the module relies on the VCTCXO for synchronization holdover, augmented by any reliable source of frequency control. In the absence of frequency control, the holdover performance is determined entirely by the VCTCXO. In some applications holdover performance will be enhanced by using an external stable (but not necessarily accurate) frequency reference.

25.2.2 Oscillator control via host

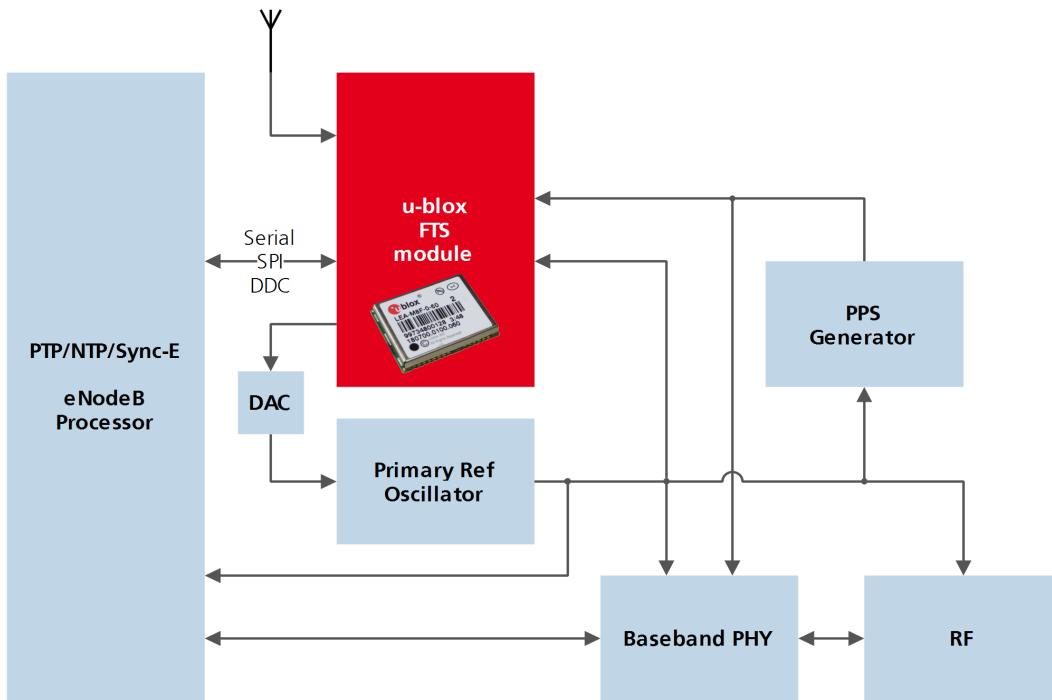

The frequency offset of the external oscillator is measured by the FTS device and communicated to the host which can then make any corrections necessary. The FTS device also generates a PPS phase reference internally (with no guarantee of coherence with the external oscillator). During holdover, the phase of 1PPS signal is maintained using either the primary reference oscillator or the 1PPS_In signal, according to their respective uncertainty.

25.2.3 Oscillator control via directly-connected DAC

In this use case, the FTS device disciplines an external oscillator via an external DAC. During holdover the input to the external DAC is frozen and the phase of the time pulse output is maintained by the primary reference oscillator, but only guaranteed to be fully coherent with the internal oscillator. The FTS receiver can also be commanded to perform a one-off calibration of the tuning slope of external oscillator if necessary.

25.2.4 External (coherent) PPS

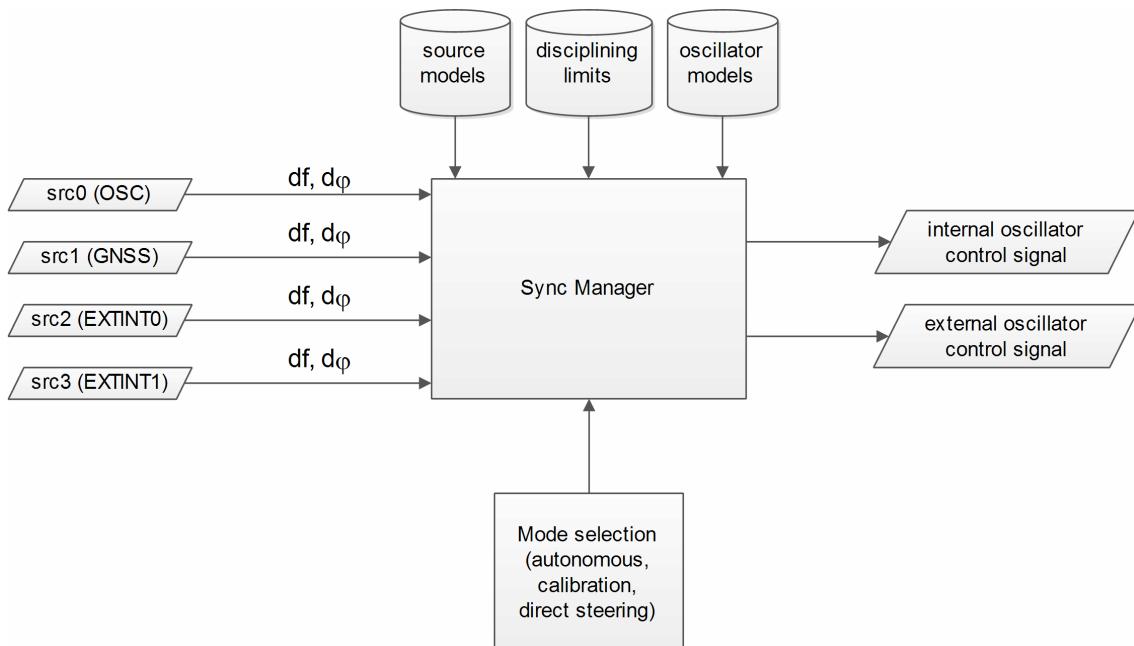

In this use case, the system PPS is generated by an external device from the output of the primary reference oscillator. The FTS receiver measures the phase of this PPS input against GNSS time or the best available source. Any small phase corrections necessary can be made by the receiver via adjustments to the oscillator frequency or directly by the host to the PPS generator (e.g. to accelerate removal of large phase errors). During holdover the DAC input is frozen.

25.3 Synchronization Manager Concept

The Synchronization Manager (SMGR) assumes the frequency and phase control functions in FTS configured devices. The SMGR uses internal and external phase and frequency measurements to derive the disciplining values (necessary frequency changes) and to assess the quality (uncertainty) of the time pulse signal and the frequency outputs. The SMGR considers the following synchronization sources:

- The GNSS solutions
- Internal oscillator
- Up to two external signals: frequency or time pulse (e.g. 1PPS) reference signals on EXTINT0 and/or EXTINT1
- Externally conducted measurements, from which the results are sent to the receiver through one of the host interfaces

Each measurement provides frequency offset and/or phase information along with an estimate of the uncertainty of each. The SMGR functional block diagram is given below:

The user has the option to configure how the SMGR considers the external signals, e.g. time or frequency source, disciplined or not, etc... The user must also configure the uncertainty of the signals along with their nominal characteristics. One of the external signals may be configured as the feedback path of a disciplined external oscillator.

The SMGR can operate in frequency locked or in phase locked mode. In frequency locked mode the target of the SMGR is to eliminate frequency error. In phase locked mode the elimination of time error is the goal; this may lead to intentional deviation from the correct oscillator frequency. The correction rate in both of these modes is subject to configurable limits (see [UBX-CFG-SMGR](#)). The SMGR runs periodically (typically once a second). Its operation consists of the following stages each time it is executed:

- Choose the best source to be the reference, given the characteristics (phase noise and stability) of each of the sources and the uncertainty of their measurements.
- Calculate the phase and/or frequency errors as well as their uncertainty for each of the disciplined oscillators with respect to the reference source.
- Calculate correction for disciplined oscillators; time and/or frequency corrections are limited to the configured limits.
- Map frequency adjustment to physical output.

The SMGR runs periodically and retrieves the most recent measurements for each source along with the estimates about their respective uncertainty. The relative phase and/or frequency errors of disciplined oscillators with respect to the reference are calculated from incoming measurements and used to discipline them. The decision-making process as such does not depend on decisions made previously, however it does rely on the estimated uncertainty for each source, which is determined by comparing predicted and measured values over some moderate period of time. The SMGR only uses a single reference source at any one time. It does not combine measurements from different sources in any way. If the selected reference provides a time error measurement then a phase locked loop is possible, otherwise the receiver automatically enters frequency lock even if configured to maintain a phase lock.

In some cases the host software might choose to drive an oscillator directly. This may be useful where a large timing error has accumulated (e.g. after a long period of holdover) and normal operation would prevent the error being corrected swiftly. In this case, the host can deliberately steer the oscillator to correct timing in large

steps as configured maximum phase and frequency change limits are not applied to adjustments commanded by the host. Another use of the direct host-driven steering may be the calibration of other parts of the system. Use [UBX-TIM-HOC](#) message for this functionality.

If the time error is so large that its correction would take prohibitively long even with maximum frequency offset of the oscillator the receiver can be switched to non-coherent time pulse output mode. In this case the sync manager is temporarily reconfigured to allow time pulse intervals that are not coherent with the frequency output, i.e. there are more or less than the nominal number of cycles between two pulses. The user may optionally specify a limit on time adjustments. The output mode can be set to coherent again once the time error is sufficiently small.

A SMGR summary status is provided by [UBX-MON-SMGR](#) message.

The SMGR runs at the navigation rate set by [UBX-CFG-RATE](#). For FTS configured devices, it is not recommended to use navigation rates higher than 1Hz.

25.4 Oscillator and source specification

For correct operation, the frequency, phase and stability characteristics of all sources and disciplined oscillators must be described. External synchronization sources are configured with [UBX-CFG-ESRC](#) and disciplined oscillators with [UBX-CFG-DOSC](#). The models (short and long term stability behavior) specified by these messages provide the SMGR with the knowledge necessary to its decision making.

The user must also configure the method (coherent or non-coherent) used for frequency adjustment, the maximum frequency adjustment and other parameters contained in [UBX-CFG-DOSC](#).

It is assumed that an external voltage-controlled oscillator has a constant ratio of relative frequency change to control voltage change. The oscillator is therefore characterized by two metrics: an offset (control voltage for nominal frequency) and a gain (relative frequency change per control step). Each of these parameters are known along with their uncertainty. It is assumed that the oscillator control gain is stable over time but its offset may change significantly with aging. Because of the drift of the offset, its saved value is regularly updated in the model. The gain, on the other hand, is only updated on demand by the host application by re-configuration or calibration. For the measurement of the gain a special auto-calibration is available, described in the [calibration section](#).

External oscillator stability (frequency changes) is described by four parameters (see [UBX-CFG-DOSC](#)):

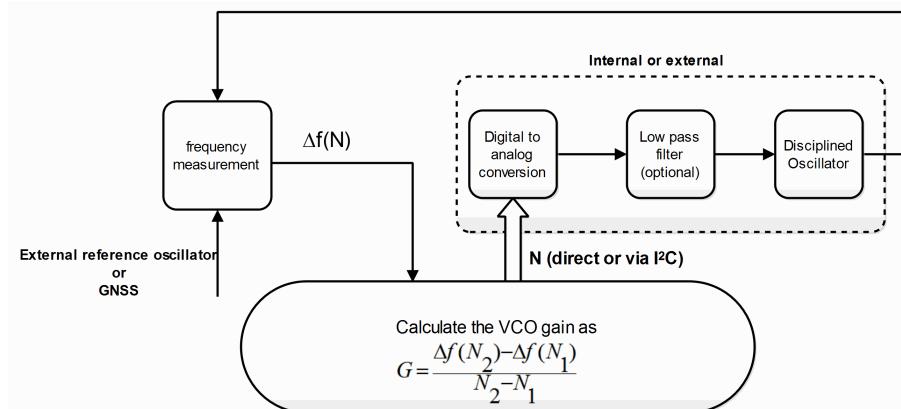

- changes with temperature: `withTemp` is the maximum deviation limit from the nominal frequency at the reference temperature over the supported temperature range (in ppb) and `timeToTemp` (in s) which is a period after which the maximum deviation limit is reached.
- aging: `maxDevLifetime` is the maximum deviation from the nominal frequency (in ppb) and `withAge` is the oscillator stability with age (in ppb/year).

25.5 Calibration

Prior to disciplining an oscillator, the SMGR must have an accurate knowledge of the controlled oscillator's frequency control gain and initial frequency offset (oscillator gains may differ significantly from unit to unit and batch to batch, largely as a result of different crystal Q). The receiver provides a slope measurement utility to aid the calibration process.

The calibration utility is a special mode where all disciplining operations are suspended and therefore all disciplined oscillators, internal or external, cease to produce usable outputs. It takes place in response to a specific request ([UBX-TIM-VCOCAL](#) message) from the host to do so for a particular oscillator and only one oscillator can be calibrated at a time. During this phase, the SMGR forces large frequency variations by changing the input of the digital to analogue conversion device whose output is driving the oscillator. Several

frequency measurements are performed and a gain is estimated.

Calibration parameters must be configured or the calibration utility called before disciplining operation is possible. Once calibrated, the `calibStatus` flag in [UBX-CFG-DOSC](#) is set. The calibration utility can be re-triggered at any time by issuing the appropriate command through the [UBX-TIM-VCOCAL](#) message (not recommended during normal operation). An ongoing calibration process can be aborted using the same message with the appropriate flags. It can also be bypassed if the `calibStatus` flag in the [UBX-CFG-DOSC](#) message is set to 1 (oscillator is calibrated independently with results saved using the UBX-CFG-DOSC message).

In order to enter the calibration mode it is required that:

- A stable frequency source is available for the duration of the calibration. This source may be a GNSS solution or a frequency signal on an EXTINT pin.
- The oscillator subject to calibration is configured through the [UBX-CFG-DOSC](#) message (including an initial estimate of gain) and available for the duration of the process.

For an external oscillator it is also assumed that the useful range of the input is covered by the output of the DAC and that the relation frequency versus DAC input is linear. Once the calibration operation is complete the receiver will issue a UBX message to indicate that the SMGR is reverting to normal operation and to report the results of the calibration. A default for the internal oscillator is available in the firmware.

Note that it is important that only the chosen frequency source is enabled during the calibration process and that it remains stable throughout the calibration period; otherwise incorrect oscillator measurements will be made and this will lead to miscalibration and poor subsequent operation of the receiver.

25.6 FTS device Output and Top Of Second (TOS) message

The outputs available from an FTS device can be one or all of the following:

- A disciplined frequency source at the same frequency as the internal oscillator.
- A 1PPS or an even second signal (other similar rates are possible) coherent with the internal oscillator, configured by [UBX-CFG-TP5](#).
- Messages reporting measurement results (for example for a host disciplined external oscillator).
- A [UBX-TIM-TOS](#) message which describes the current condition (accuracy, coherent or non-coherent, etc...) of the frequency and PPS outputs.
- DAC command for disciplined external oscillators.

The top of second (TOS) message is a summary of the FTS device's status. It is output shortly after each time pulse and so will normally be aligned to the second of the reference time (if available). To guarantee that this message is output as the first message after the time pulse a system of time slot reservation is provided for all

communication interfaces towards the host. For more information on this mechanism please refer to [the description of TX time slots](#)

Users of the FTS variant are expected to use the [UBX-TIM-TOS](#) message to obtain key parameters for each time pulse. The [UBX-TIM-TP](#) message is only supported for compatibility with timing receivers and is not guaranteed to provide the most appropriate information in all FTS use cases.

The time pulse of an FTS device is generated differently from that of other u-blox receivers.

FTS products support two modes of time pulse generation: "coherent" and "non-coherent" pulses.

"Coherent" pulse generation means that the number of clock cycles between two pulses is always the same. When in "non-coherent" pulse mode the receiver may change the number of clock cycles between two pulses if it can thus reduce the phase error of the time pulse. The receiver can be configured (using [UBX-CFG-SMGR](#)) to operate in either of these modes or to switch from "non-coherent" to coherent mode after initial frequency and phase error has been eliminated.

It can be useful to instruct the receiver to enter the "non-coherent" pulse mode during startup or while recovering from holdover; it reduces the time necessary for phase convergence. After the phase error is reduced the host can instruct the FTS receiver to switch back to "coherent" mode again.

The [UBX-TIM-TOS](#) message, when enabled, indicates the actual mode of pulse generation.

Depending on the time pulse generation mode, the time pulse can be forced to be phase aligned to the oscillators. In coherent output mode the phase offset of the oscillator at the rising edge of the time pulse is defined by the phaseOffset field of [UBX-CFG-DOSC](#). In "non-coherent" mode this constraint is ignored.

The phase offset is handled differently for both oscillators. Whereas phase lock between the internal oscillator and the time pulse is guaranteed by hardware, in the case of the external oscillator the lock is achieved by software and that lock is therefore the lock behavior is expected to be different.

The frequency, shape and offset of the time pulse can be configured with the [UBX-CFG-TP5](#) message. Some of the fields are interpreted differently by FTS devices compared to other u-blox receivers. Among others the lockGnssFreq flag is ignored and the time pulse is always aligned to the best synchronization source.

Furthermore, switching between the two time pulse frequency and length parameters is not governed by GNSS alone but by the condition selected in the syncMode field.

Two delay parameters can be configured using [UBX-CFG-TP5](#), antCableDelay and userConfigDelay. In an FTS product care should be taken what delays are attributed to which of the delay terms. The antenna cable delay is only relevant when the receiver is following GNSS as reference; the user configurable delay is applied regardless of the active reference signal.

In current FTS products only TIMEPULSE 2 can be used for pulse generation. Additionally, just 0.5 Hz, 1 Hz and 2 Hz time pulse output is supported by current FTS products. Other output frequencies may be configured with [UBX-CFG-TP5](#) but are not guaranteed to work properly.

25.7 Message transmission time slot reservations on host interfaces

The firmware provides three message transmission time slots that are aligned to the time pulse output of the receiver. No message is scheduled for transmission in the first slot after the leading edge of the time pulse. The second slot is reserved for the [UBX-TIM-TOS](#) message and the third slot is used for outputting other messages. However, any message transmission that was started will be finished before a new message is started.

The time slots can be enabled and configured using [UBX-CFG-TXSLot](#).

When the reference time pulse is disabled or runs at a high frequency it may happen that many or all outgoing messages are lost. Therefore the time slot mechanism should be configured to match

the time pulse behavior or disabled altogether.

This mechanism only controls when a message transmission may start and does not guarantee that the message transmission will finish before the end of the corresponding slot. Therefore the end of the last slot should be configured such that the longest enabled message can still be transmitted before the period starts when the receiver must not transmit messages.

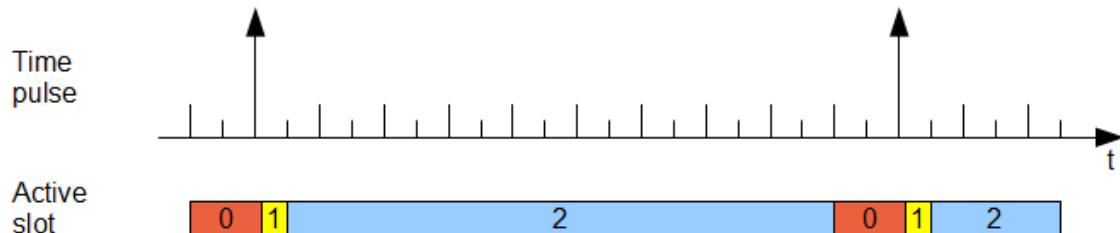

The timing of the actual message output is also dependent on the communication interface and its clocking. On the slave interfaces (DDC and SPI) the host must provide clock in all time slots for this feature to work.

25.7.1 Example setup

Following is an example scenario. The receiver is set up to output a time pulse at a 1 Hz rate. Suppose that the following requirements are given for system integration:

- The TOS message should be output 10 to 50 ms after the time pulse.
- No other message should be output from the leading edge of the time pulse until 50 ms after the time pulse.
- The longest enabled message takes up to 100 ms to transmit through the chosen interface with the configured speed.

Then the time slots are enabled and the three slots are configured to end 10, 50 and 900 ms after the pulse respectively. The following figure indicates time pulses with upwards pointing arrows. Slot 0 (the first one active immediately after the time pulse) is active and thus blocks the transmission of new messages from 100 ms before the time pulse until 10 ms after it. Time slot 1, i.e. the time between 10 and 50 ms after the pulse, is reserved for the top-of-second message. All other messages are output in slot 2.

26 RTK Mode Configuration

This feature is only available with the High Precision GNSS products

u-blox RTK technology introduces the concept of a *reference station* and a *rover*. Using the RTCM3 protocol, the reference station sends corrections to the rover via a communication link enabling the rover to compute its position relative to the reference with high accuracy.

In the high precision GNSS context, the terms reference station and base station can be used interchangeably.

The distance between the reference station and the rover is called *baseline length*.

The reference station can provide correction to several rovers but the rover cannot concurrently process corrections from several reference stations.

The remainder of this chapter describes how to configure the reference station and the rover. More details about the RTCM3 protocol can be found in the [RTCM3](#) section.

26.1 Reference Station Mode Configuration

Reference Station Mode is a special receiver mode where the receiver uses measurements from all available satellites to broadcast corrections. Configuring a stationary reference station is done in two steps:

- The receiver must be set in *Time Mode* using the configuration steps described in the [Time Mode Configuration](#) section.
- The RTCM3 correction stream must be configured following the rules detailed in the [RTCM3 Configuration](#) section. Each RTCM message must be individually enabled using [UBX-CFG-MSG](#).

By default the reference station will begin operation in standard GNSS mode without any RTCM output. Messages for observations will be streamed as soon as they are configured for output. However messages for the reference station position will only be output when both the reference station is in fixed position mode, and the message is configured for output. As explained in the [Time Mode Configuration](#) section, this mode can be directly configured or reached at the end of a successful survey-in.

The rover will need to have received both reference station observation messages and reference station position messages in order to attempt ambiguity fixes.

When the reference station is in Time Mode, some error checking is performed on the entered, or surveyed-in, fixed position. If the result of these checks indicates that the fixed position may be incorrect, then a [UBX-INF-WARNING](#) message will be sent, with the text "Reference Station position seems incorrect".

26.2 Rover Mode Configuration

The RTK rover can be configured to work in either of these two differential modes using [UBX-CFG-DGNSS](#):

- **RTK fixed:** In this mode, the rover will attempt to fix ambiguities whenever possible.
- **RTK float:** In this mode, the rover will estimate the ambiguities as float but will make no attempts at fixing them.

The time after which old RTCM data will be discarded can be specified using the *dgnssTimeout* field in [UBX-CFG-NAV5](#).

By default the rover will begin operation in RTK fixed mode. Upon receiving an RTCM3 correction stream on any of its communication interfaces, the rover will parse the data, apply the correction and, if possible, fix ambiguities. In absence of correction data or if the correction data times out, the rover will operate in standard GNSS mode.

The time needed to resolve the ambiguity is affected by the baseline length as well as by multipath and satellite visibility at both rover and reference station.

26.3 Moving Baseline RTK Configuration

The moving baseline (MB) RTK mode differs from the standard RTK mode in that it does not require the reference to be stationary at a known location. In MB RTK mode, both the reference station and rover receivers can move while computing a centimeter-level accurate 3D vector between them. This is ideal for applications where the relative position offset between two moving vehicles is required such as, for example, the follow-me feature on a UAV.

For the sake of conciseness, in the moving baseline RTK context, the reference station and rover receivers are referred to as MB reference and MB rover, respectively.

26.3.1 MB Reference Configuration

Configuring a receiver to operate in MB reference mode is done in two steps:

- The receiver must be set in *Time Mode disabled* using the configuration message [UBX-CFG-TMODE3](#).
- The RTCM3 correction stream must be configured following the rules detailed in the [RTCM3 Configuration](#) section. Each RTCM message must be individually enabled using [UBX-CFG-MSG](#).

If the MB reference moves, then its position changes over time. To ensure that the baseline is as accurate as possible:

- The MB reference position must be sent for each epoch the MB reference observations are sent.
- The MB reference and rover must use the same navigation update rate.

26.3.2 MB Rover Configuration

As in the standard RTK mode, it is possible to configure the MB rover to operate in RTK fixed or RTK float using the [UBX-CFG-DGNSS](#) message.

By default the MB rover will begin operation in RTK fixed mode.

As discussed in the [Moving Baseline Expected Performance](#) section, RTCM corrections can only be extrapolated over a few seconds when both reference and rover receivers are moving. Therefore, any dgnssTimeout value configured using the [UBX-CFG-NAV5](#) message will be ignored by the MB rover.

26.3.3 Expected Performance

While the MB RTK solution aims at estimating the relative position with centimeter-level accuracy, the absolute position of each receiver is expected to be known with a standard GNSS accuracy of a few meters. Additionally, the performance of the MB RTK solution is limited by the following:

- A moving reference receiver typically experiences worse GNSS tracking than a static reference receiver in an open-sky environment and therefore the MB RTK performance may be degraded.
- The MB rover can only compute an optimal MB RTK solution if the time-matched RTCM observation and position messages are received within a predefined time limit. The MB rover will wait up to **700 ms** for messages before falling back to an extrapolated MB RTK solution. The MB rover will extrapolate the MB reference observations and/or position for up to **3 s** before falling back to standard GNSS operation.
- The achievable update rate of the MB RTK solution is limited by the communication link latency. As a rule of thumb, the communication link latency should be about half the desired navigation update period. If it exceeds 700 ms, the MB rover will not be able to compute an MB RTK solution, even at 1 Hz.
- Since the MB rover must wait for time-matched RTCM corrections from the MB RTK reference to compute its position, the overall latency of the MB RTK solution will be the sum of the communication link latency plus the MB RTK computation time.

When falling back to standard GNSS operation, the MB rover will automatically adjust the accuracy and status flag information contained in the messages listed in the [RTCM3 Output](#) section.

Upon recovering the RTCM correction stream, the MB rover will automatically try to revert to MB RTK operation.

27 Automotive Dead Reckoning (ADR)

This feature is only available with the ADR products.

27.1 Introduction

u-blox solutions for Automotive Dead Reckoning (ADR) allow high-accuracy positioning in places with poor or no GNSS coverage. ADR is based on Sensor Fusion Dead Reckoning (SFDR) technology, which combines GNSS measurements with those from external sensors.

ADR solutions use the messages of the [External Sensor Fusion \(ESF\) class](#).

27.2 ADR System Configuration

27.2.1 Enabling/Disabling Fusion Filter

The ADR fusion filter can be turned-off by means of the `useAdr` bit in the [UBX-CFG-NAVX5](#) configuration message. If fusion is turned-off, the receiver outputs a GNSS-only solution.

27.2.2 Recommended Configuration

For an optimum ADR navigation performance, the recommended general configuration is the following:

- **Navigation Rate:** the standard navigation solution update rate of 1 Hz (see [UBX-CFG-RATE](#) message) is recommended. The wheel tick quantization error is a limiting factor when using high frequency updates. This means that navigation rates higher than 1 Hz may result in lower position accuracies.

27.3 Operation

This section describes how the ADR receiver operates.

27.3.1 Fusion Filter Modes

The fusion filter operates in different modes which are output in the [UBX-ESF-STATUS](#) message.

More details about each fusion mode are given in the sequel.

27.3.1.1 Initialization Mode

The purpose of the initialization phase is to estimate all unknown parameters which are required for achieving fusion. The initialization phase is triggered after a receiver coldstart or a filter reset in case of fusion failure. The receiver is in initialization mode if the `fusionMode` field in the [UBX-ESF-STATUS](#) message is 0 : `INITIALIZING`. In this case the required sensor calibration status (`calibStatus`) are flagged as 0 : `NOT CALIBRATED` and the navigation solution output during initialization is based on GNSS solely.

Note that initialization phase requires good GNSS signal conditions as well as periods during which vehicle is stationary and moving (including turns). Once all required initialization steps are achieved, fusion mode is triggered and the calibration phase begins.

27.3.1.2 Fusion Mode

Once initialization phase is achieved, the receiver enters navigation mode. The receiver is in fusion mode if the `fusionMode` field in the [UBX-ESF-STATUS](#) message is set on 1 : `FUSION`. The fusion filter then starts to compute combined GNSS/Dead-reckoning fixes (fused solutions) and to calibrate the sensors required for computing the fused navigation solution (used bit set). This is the case when the sensor calibration status (`calibStatus`) is flagged as 1 : `CALIBRATING`. As soon as the calibration reached a status where optimal fusion

performance can be expected, the sensor calibration status is flagged as 2 / 3 : CALIBRATED.

27.3.1.3 Suspended Fusion Mode

Sensor fusion can be temporarily suspended in cases where no fused solution should/can be computed. The receiver is in the temporarily disabled fusion mode if the `fusionMode` field in the [UBX-ESF-STATUS](#) message is set on 2 : SUSPENDED. In this case, the receiver computes a GNSS-only solution.

Fusion is suspended if:

- One or several sensors deliver erroneous data or no data at all, the fusion is suspended during the sensor failure period. The receiver automatically recovers once the affected sensor(s) is/are back to normal operation.

27.3.1.4 Disabled Fusion Mode

Sensor fusion can be permanently switched-off in cases where recurrent fusion failures happen or user turned-off manually fusion. The receiver is in the permanently disabled fusion mode if the `fusionMode` field in the [UBX-ESF-STATUS](#) message is set on 3 : DISABLED. In such a case, the receiver computes a GNSS-only solution.

Fusion is permanently disabled in the following cases:

- If the fusion filter was manually turned-off by the user (`useAdr` bit in the [UBX-CFG-NAVX5](#) message is not set).
- If the fusion filter encountered too many errors.

27.3.2 Accelerated Initialization and Calibration Procedure

This section describes how to perform fast initialization and calibration of the ADR receiver for the purpose of evaluation.

The duration of the initialization phase mostly depends on the quality of the GNSS signals and the dynamics encountered by the vehicle. Therefore the car should be driven to an open and flat area like an empty open-sky parking area for example. The initialization and calibration drive should contain phases where the car is stopped during a few minutes (with engine turned-on), phases where the car is doing normal left and right turns and phases where speed is above 30 km/h under good GNSS reception conditions.

Once initialization is completed, the `fusionMode` field in the [UBX-ESF-STATUS](#) message switches to 1 : FUSION, combined GNSS/Dead-reckoning fixes (fused solutions) are output and the sensors used in the navigation filter start to get calibrated. Calibration is a continuous process running in the background and directly impacting the navigation solution quality.

Note that the calibration status (`calibStatus` in [UBX-ESF-STATUS](#) message) of some used sensors might fall back to 1 : CALIBRATING if the receiver is operated in challenging conditions. In such a case, fused navigation solution uncertainty increases until optimal conditions are observed again for re-calibrating the sensors.

27.3.3 Navigation Output

27.3.3.1 Local-level North-East-Down (NED) Frame

The local-level frame is a geodetic frame with following features:

- The origin (O) is a point on the Earth surface;
- The x-axis points to North;
- the y-axis points to East;

- the z-axis completes the right-handed reference system by pointing down.

The frame is referred to as North-East-Down (NED) since its axes are aligned with the North, East and Down directions.

27.3.3.2 Vehicle-Frame

The vehicle-frame is a right-handed 3D Cartesian frame rigidly connected with the vehicle and is used to determine the attitude of the vehicle with respect to the local-level frame. It has the following features:

- The origin (O) is the [VRP](#);
- The x-axis points towards the front of the vehicle;
- the y-axis points towards the right of the vehicle;
- the z-axis completes the right-handed reference system by pointing down.

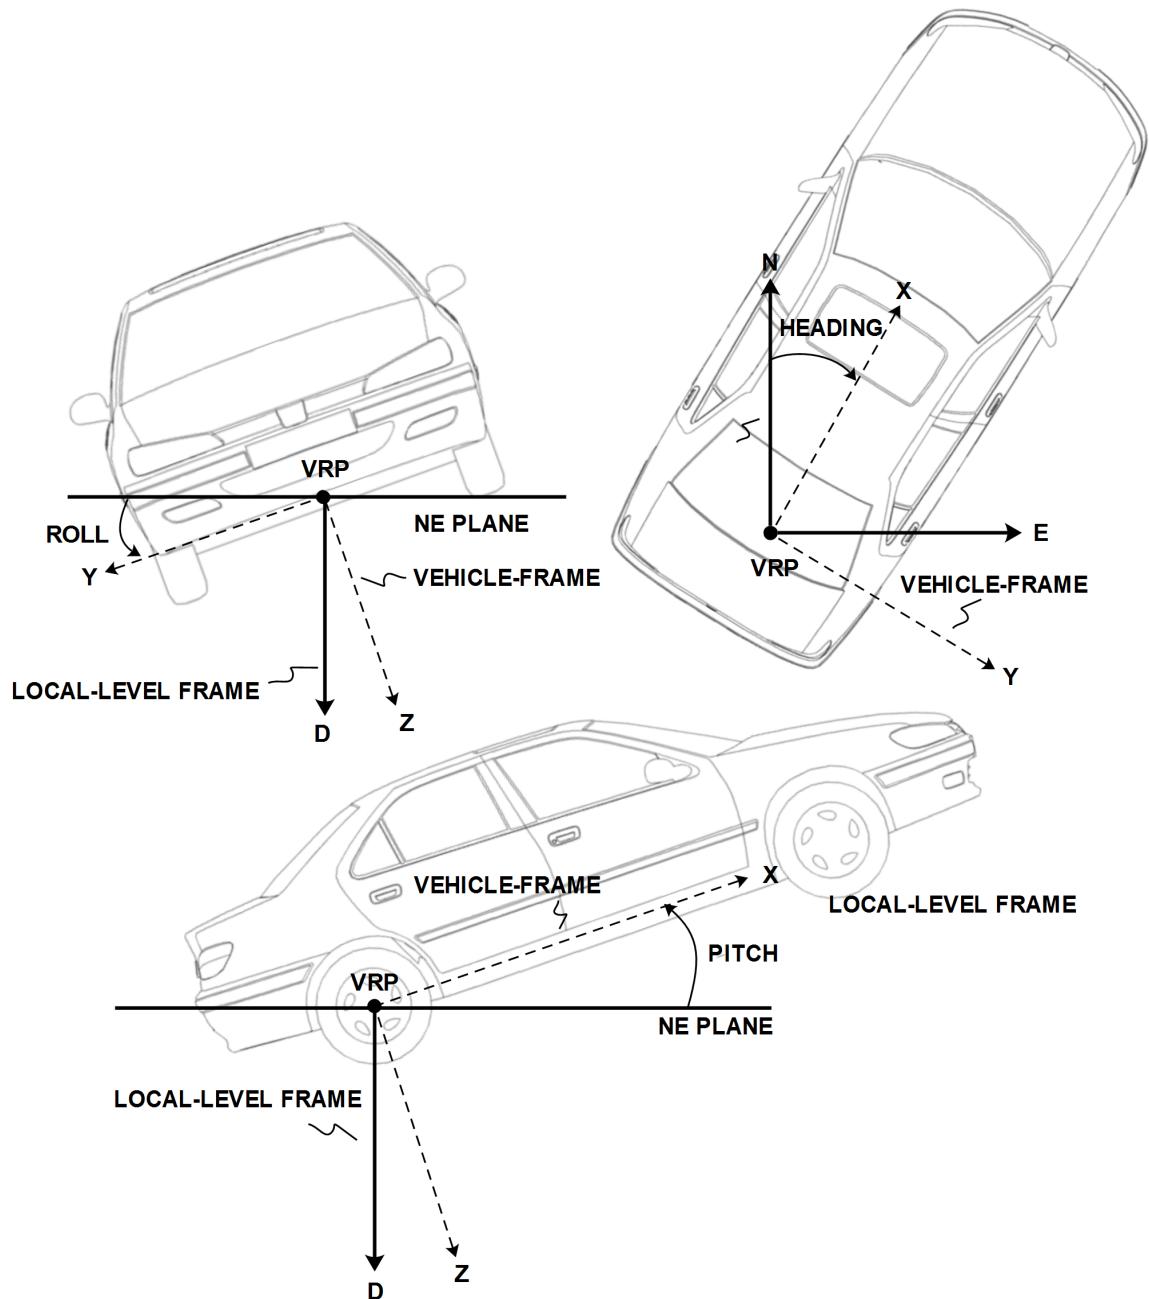

27.3.3.3 Vehicle Position and Velocity Output

The position and velocity information is output in several messages like [UBX-NAV-PVT](#) for example. The position computed by the ADR navigation filter is referenced to the [VRP](#).

27.3.3.4 Vehicle Attitude Output

(Only supported in [protocol versions 19+](#)).

The transformation between the [vehicle-frame](#) and the [local-level frame](#) is described by three attitude angles about the local-level axes denoted as *vehicle roll*, *vehicle pitch* and *vehicle heading*. All three angles are referred as *vehicle attitude* and are illustrated in the figure below:

NOTES:

N = NORTH, E = EAST, D = DOWN, IMU-FRAME ALIGNED WITH VEHICLE-FRAME

The order of the sequence of rotations around the navigation axes defining the vehicle attitude matrix in terms of vehicle attitude angles is illustrated below:

VEHICLE ATTITUDE DEFINITION

ϕ : Vehicle roll angle

θ : Vehicle pitch angle

ψ : Vehicle heading angle

\mathbf{C}_b^n : Rotation between body-frame (b) and local-level NED navigation-frame (n)

$$\mathbf{C}_X = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos(\phi) & \sin(\phi) \\ 0 & -\sin(\phi) & \cos(\phi) \end{bmatrix} \quad \mathbf{C}_Y = \begin{bmatrix} \cos(\theta) & 0 & -\sin(\theta) \\ 0 & 1 & 0 \\ \sin(\theta) & 0 & \cos(\theta) \end{bmatrix} \quad \mathbf{C}_Z = \begin{bmatrix} \cos(\psi) & \sin(\psi) & 0 \\ -\sin(\psi) & \cos(\psi) & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\mathbf{C}_b^n = \mathbf{C}_Z^T \cdot \mathbf{C}_Y^T \cdot \mathbf{C}_X^T$$

$$= \begin{bmatrix} \cos(\theta)\cos(\psi) & \sin(\phi)\sin(\theta)\cos(\psi) - \cos(\phi)\sin(\psi) & \cos(\phi)\sin(\theta)\cos(\psi) + \sin(\phi)\sin(\psi) \\ \cos(\theta)\sin(\psi) & \sin(\phi)\sin(\theta)\sin(\psi) + \cos(\phi)\cos(\psi) & \cos(\phi)\sin(\theta)\sin(\psi) - \sin(\phi)\cos(\psi) \\ -\sin(\theta) & \sin(\phi)\cos(\theta) & \cos(\phi)\cos(\theta) \end{bmatrix}$$

Note that in this picture the body-frame corresponds to the [vehicle-frame](#).

The vehicle attitude is output in the [UBX-NAV-ATT](#) message. The message provides all three angles together with their accuracy estimates.

ADR products do not compute a roll angle.

27.3.3.5 Vehicle Dynamics Output

(Only supported in [protocol versions 19+](#)).

The [UBX-ESF-INS](#) message outputs information about vehicle dynamics provided by the INS: compensated vehicle angular rates and compensated vehicle accelerations. The acceleration data is free of any gravitational acceleration. Its accuracy is directly dependent on the filter attitude estimation accuracy.

Compensated vehicle dynamics information is output with respect to the [vehicle-frame](#).

The message outputs only dynamics information that is directly compensated by the fusion filter.

This implies that depending on the solution type and the sensor availability, dynamics along some axes of the [vehicle-frame](#) might not be available.

27.3.4 Sensor Data Types

The supported sensor data types are:

Definition of Data Types

| Type | Description | Unit | Format of the 24 data bits |
|------|-----------------------------------|-------------|---|
| 0 | none, data field contains no data | | |
| 1..4 | reserved | | |
| 5 | z-axis gyroscope angular rate | deg/s *2^12 | signed |
| 6 | front-left wheel ticks | | Bits 0-22: unsigned tick value. Bit 23: direction indicator (0=forward, 1=backward) |

Definition of Data Types continued

| Type | Description | Unit | Format of the 24 data bits |
|------|-------------------------------------|--------------------|---|
| 7 | front-right wheel ticks | | Bits 0-22: unsigned tick value. Bit 23: direction indicator (0=forward, 1=backward) |
| 8 | rear-left wheel ticks | | Bits 0-22: unsigned tick value. Bit 23: direction indicator (0=forward, 1=backward) |
| 9 | rear-right wheel ticks | | Bits 0-22: unsigned tick value. Bit 23: direction indicator (0=forward, 1=backward) |
| 10 | single tick (speed tick) | | Bits 0-22: unsigned tick value. Bit 23: direction indicator (0=forward, 1=backward) |
| 11 | speed | m/s * 1e-3 | signed |
| 12 | gyroscope temperature | deg Celsius * 1e-2 | signed |
| 13 | y-axis gyroscope angular rate | deg/s *2^-12 | signed |
| 14 | x-axis gyroscope angular rate | deg/s *2^-12 | signed |
| 16 | x-axis accelerometer specific force | m/s^2 *2^-10 | signed |
| 17 | y-axis accelerometer specific force | m/s^2 *2^-10 | signed |
| 18 | z-axis accelerometer specific force | m/s^2 *2^-10 | signed |

27.3.5 Raw Sensor Data Output

(This feature is not supported in [protocol versions less than 15.01](#)).

Some u-blox module products contain inertial sensors (IMU) that are directly connected to the GNSS and cannot be directly accessed from outside the module. The [UBX-ESF-RAW](#) message can be used to access raw measurements of these sensors. A variable number of data fields may be used in a single message and these can contain different types of measurements. The type of each measurement is specified in the `dataType` field. The possible data types are x, y and z-axis measurements on gyroscope or accelerometer and gyroscope temperature measurements as described in the [ESF Measurement Data](#) section. One [UBX-ESF-RAW](#) message can contain multiple samples from the same sensor. The user can separate and order these using the time tags attached to each of the measurements.

The measurements are made at a fixed rate. The sampling rate or other sensor configuration options can not be changed.

To turn on this feature the [UBX-ESF-RAW](#) message must be enabled using [UBX-CFG-MSG](#). If non-zero rate is selected the message will be output but the selected rate does not otherwise have an influence at the rate of the messages.

Turning on this feature does not disable sensor fusion in the receiver. To use an external fusion algorithm consider disabling the automotive dead reckoning mode using [UBX-CFG-NAVX5](#).

27.3.6 Receiver Startup and Shutdown

Continuous dead reckoning is possible over receiver restarts if the following conditions are true:

- The vehicle is not moved while the receiver is off

During periods of external sensor data unavailability the receiver switches to GNSS-only navigation if the last sensor information indicated the vehicle was moving.

28 Untethered Dead Reckoning (UDR)

This feature is only available with the [UDR](#) products.

28.1 Introduction

u-blox solution for Untethered Dead Reckoning (UDR) allows improved navigation performance in places with GNSS-denied conditions as well as during short GNSS outages. UDR is based on Sensor Fusion Dead Reckoning (SFDR) technology, which integrates an Inertial Navigation System (INS) with GNSS measurements. The INS integrates angular rates and specific forces sensed by an Inertial Measurement Unit (IMU). The INS computes position, velocity and attitude changes and can, once initialized, provide accurate navigation information. However, an inertial-only navigation solution would degrade quickly with time due to the errors corrupting the IMU observations. The integration of the INS with GNSS measurements bounds these time-growing errors by calibrating the INS. The resulting integrated INS/GNSS filter, called *fusion filter* below, has the following advantages compared to standalone GNSS positioning:

- Improved navigation performance in GNSS-denied conditions: errors caused by multipath or weak signal conditions are mitigated through the aid brought by the IMU.
- Navigation solution during short GNSS-outages: the INS bridges short GNSS gaps which might be caused by tunnels or parking garages.

UDR solution uses the messages of the [External Sensor Fusion \(ESF\)](#) class.

28.2 UDR System Configuration

(These features are not supported in [protocol versions less than 19](#)).

28.2.1 Enabling/Disabling Fusion Filter

The UDR fusion filter can be turned-off by means of the `useAdr` bit in the [UBX-CFG-NAVX5](#) configuration message. If fusion is turned-off, the receiver outputs a GNSS-only solution.

28.2.2 Recommended Configuration

For an optimum navigation performance, the recommended general configuration is the following:

- **Navigation Rate:** the standard navigation solution update rate of 1 Hz (see [UBX-CFG-RATE](#) message) is recommended.

28.3 Operation

This section describes how the UDR receiver operates.

28.3.1 Fusion Filter Modes

The fusion filter operates in different modes which are output in the [UBX-ESF-STATUS](#) message.

More details about each fusion mode are given in the sequel.

28.3.1.1 Initialization Mode

The purpose of the initialization phase is to estimate all unknown parameters which are required for achieving fusion. The initialization phase is triggered after a receiver coldstart or a filter reset in case of fusion failure. The receiver is in initialization mode if the `fusionMode` field in the [UBX-ESF-STATUS](#) message is 0 :

INITIALIZING. In this case the required sensor calibration status (`calibStatus`) are flagged as 0 : NOT CALIBRATED and the navigation solution output during initialization is based on GNSS solely.

Note that initialization phase requires good GNSS signal conditions as well as periods during which vehicle is stationary and moving (including turns). Once all required initialization steps are achieved, fusion mode is triggered and the calibration phase begins.

28.3.1.2 Fusion Mode

Once initialization phase is achieved, the receiver enters navigation mode. The receiver is in fusion mode if the `fusionMode` field in the [UBX-ESF-STATUS](#) message is set on 1 : FUSION. The fusion filter then starts to compute combined GNSS/Dead-reckoning fixes (fused solutions) and to calibrate the sensors required for computing the fused navigation solution (used bit set). This is the case when the sensor calibration status (`calibStatus`) is flagged as 1 : CALIBRATING. As soon as the calibration reached a status where optimal fusion performance can be expected, the sensor calibration status is flagged as 2 / 3 : CALIBRATED.

28.3.1.3 Suspended Fusion Mode

Sensor fusion can be temporarily suspended in cases where no fused solution should/can be computed. The receiver is in the temporarily disabled fusion mode if the `fusionMode` field in the [UBX-ESF-STATUS](#) message is set on 2 : SUSPENDED. In this case, the receiver computes a GNSS-only solution.

Fusion is suspended if:

- One or several sensors deliver erroneous data or no data at all, the fusion is suspended during the sensor failure period. The receiver automatically recovers once the affected sensor(s) is/are back to normal operation.

28.3.1.4 Disabled Fusion Mode

Sensor fusion can be permanently switched-off in cases where recurrent fusion failures happen or user turned-off manually fusion. The receiver is in the permanently disabled fusion mode if the `fusionMode` field in the [UBX-ESF-STATUS](#) message is set on 3 : DISABLED. In such a case, the receiver computes a GNSS-only solution.

Fusion is permanently disabled in the following cases:

- If the fusion filter was manually turned-off by the user (`useAdr` bit in the [UBX-CFG-NAVX5](#) message is not set).
- If the fusion filter encountered too many errors.

28.3.2 Accelerated Initialization and Calibration Procedure

This section describes how to perform fast initialization and calibration of the UDR receiver for the purpose of evaluation.

The duration of the initialization phase mostly depends on the quality of the GNSS signals and the dynamics encountered by the vehicle. Therefore the car should be driven to an open and flat area like an empty open-sky parking area for example. The initialization and calibration drive should contain phases where the car is stopped during a few minutes (with engine turned-on), phases where the car is doing normal left and right turns and phases where speed is above 30 km/h under good GNSS reception conditions.

Once initialization is completed, the `fusionMode` field in the [UBX-ESF-STATUS](#) message switches to 1 : `FUSION`, combined GNSS/Dead-reckoning fixes (fused solutions) are output and the sensors used in the navigation filter start to get calibrated. Calibration is a continuous process running in the background and improving the navigation solution quality.

Note that the calibration status (`calibStatus` in [UBX-ESF-STATUS](#) message) of some used sensors might fall back to 1 : `CALIBRATING` if the receiver is operated in challenging conditions. In such a case, fused navigation solution uncertainty increases until optimal conditions are observed again for re-calibrating the sensors.

28.3.3 Navigation Output

(Only supported in [protocol versions 19+](#)).

28.3.3.1 Local-level North-East-Down (NED) Frame

The local-level frame is a geodetic frame with following features:

- The origin (O) is a point on the Earth surface;
- The x-axis points to North;
- the y-axis points to East;
- the z-axis completes the right-handed reference system by pointing down.

The frame is referred to as North-East-Down (NED) since its axes are aligned with the North, East and Down directions.

28.3.3.2 Body-Frame

The body-frame is a right-handed 3D Cartesian frame rigidly connected with the vehicle and is used to determine the attitude of the vehicle with respect to the local-level frame. It has the following features:

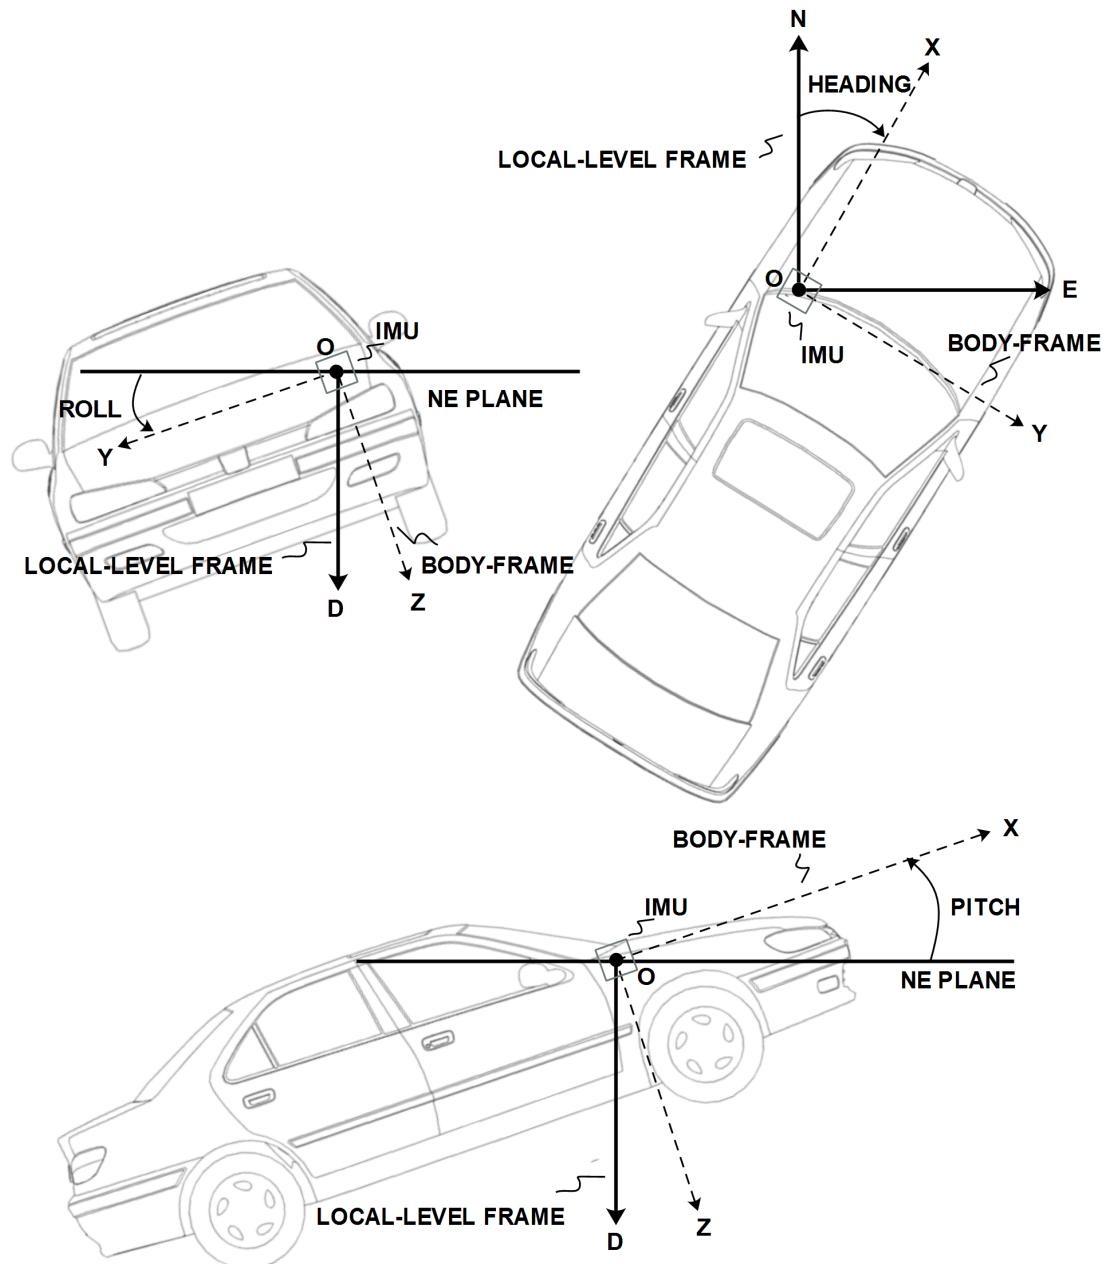

- The origin (O) is the origin of the IMU instrumental frame;
- The x-axis points towards the front of the vehicle;
- the y-axis points towards the right of the vehicle;
- the z-axis completes the right-handed reference system by pointing down.

28.3.3.3 Vehicle Position and Velocity Output

The position and velocity information is output in several messages like [UBX-NAV-PVT](#) for example. The position computed by the UDR navigation filter is referenced to the origin (O) of the [body-frame](#).

28.3.3.4 Vehicle Attitude Output

The transformation between the [body-frame](#) and the [local-level frame](#) is described by three attitude angles about the local-level axes denoted as *vehicle roll*, *vehicle pitch* and *vehicle heading*. All three angles are referred as *vehicle attitude* and are illustrated in the figure below:

NOTES:
N = NORTH, E = EAST, D = DOWN, IMU-FRAME ALIGNED WITH BODY-FRAME

The order of the sequence of rotations around the navigation axes defining the vehicle attitude matrix in terms of vehicle attitude angles is illustrated below:

VEHICLE ATTITUDE DEFINITION

ϕ : Vehicle roll angle

θ : Vehicle pitch angle

ψ : Vehicle heading angle

\mathbf{C}_b^n : Rotation between body-frame (b) and local-level NED navigation-frame (n)

$$\mathbf{C}_X = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos(\phi) & \sin(\phi) \\ 0 & -\sin(\phi) & \cos(\phi) \end{bmatrix} \quad \mathbf{C}_Y = \begin{bmatrix} \cos(\theta) & 0 & -\sin(\theta) \\ 0 & 1 & 0 \\ \sin(\theta) & 0 & \cos(\theta) \end{bmatrix} \quad \mathbf{C}_Z = \begin{bmatrix} \cos(\psi) & \sin(\psi) & 0 \\ -\sin(\psi) & \cos(\psi) & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\mathbf{C}_b^n = \mathbf{C}_Z^T \cdot \mathbf{C}_Y^T \cdot \mathbf{C}_X^T$$

$$= \begin{bmatrix} \cos(\theta)\cos(\psi) & \sin(\phi)\sin(\theta)\cos(\psi) - \cos(\phi)\sin(\psi) & \cos(\phi)\sin(\theta)\cos(\psi) + \sin(\phi)\sin(\psi) \\ \cos(\theta)\sin(\psi) & \sin(\phi)\sin(\theta)\sin(\psi) + \cos(\phi)\cos(\psi) & \cos(\phi)\sin(\theta)\sin(\psi) - \sin(\phi)\cos(\psi) \\ -\sin(\theta) & \sin(\phi)\cos(\theta) & \cos(\phi)\cos(\theta) \end{bmatrix}$$

The vehicle attitude is output in the [UBX-NAV-ATT](#) message. The message provides all three angles together with their accuracy estimates. Note that since no backwards motion information is measured, no heading of motion information is output in the [UBX-NAV-PVT](#) message (heading of vehicle is provided in a separate field within the same message).

28.3.3.5 Vehicle Dynamics Output

The [UBX-ESF-INS](#) message outputs information about vehicle dynamics provided by the INS: compensated vehicle angular rates and compensated vehicle accelerations. The acceleration data is free of any gravitational acceleration. Its accuracy is directly dependent on the filter attitude estimation accuracy.

Compensated vehicle dynamics information is output with respect to the [body-frame](#).

28.3.4 Sensor Data Types

The supported sensor data types are:

Definition of Data Types

| Type | Description | Unit | Format of the 24 data bits |
|------|-----------------------------------|-------------|---|
| 0 | none, data field contains no data | | |
| 1..4 | reserved | | |
| 5 | z-axis gyroscope angular rate | deg/s *2^12 | signed |
| 6 | front-left wheel ticks | | Bits 0-22: unsigned tick value. Bit 23: direction indicator (0=forward, 1=backward) |
| 7 | front-right wheel ticks | | Bits 0-22: unsigned tick value. Bit 23: direction indicator (0=forward, 1=backward) |

Definition of Data Types continued

| Type | Description | Unit | Format of the 24 data bits |
|------|-------------------------------------|--------------------|---|
| 8 | rear-left wheel ticks | | Bits 0-22: unsigned tick value. Bit 23: direction indicator (0=forward, 1=backward) |
| 9 | rear-right wheel ticks | | Bits 0-22: unsigned tick value. Bit 23: direction indicator (0=forward, 1=backward) |
| 10 | single tick (speed tick) | | Bits 0-22: unsigned tick value. Bit 23: direction indicator (0=forward, 1=backward) |
| 11 | speed | m/s * 1e-3 | signed |
| 12 | gyroscope temperature | deg Celsius * 1e-2 | signed |
| 13 | y-axis gyroscope angular rate | deg/s *2^-12 | signed |
| 14 | x-axis gyroscope angular rate | deg/s *2^-12 | signed |
| 16 | x-axis accelerometer specific force | m/s^2 *2^-10 | signed |
| 17 | y-axis accelerometer specific force | m/s^2 *2^-10 | signed |
| 18 | z-axis accelerometer specific force | m/s^2 *2^-10 | signed |

28.3.5 Raw Sensor Data Output

(This feature is not supported in [protocol versions less than 15.01](#)).

Some u-blox module products contain inertial sensors (IMU) that are directly connected to the GNSS and cannot be directly accessed from outside the module. The [UBX-ESF-RAW](#) message can be used to access raw measurements of these sensors. A variable number of data fields may be used in a single message and these can contain different types of measurements. The type of each measurement is specified in the `dataType` field. The possible data types are x, y and z-axis measurements on gyroscope or accelerometer and gyroscope temperature measurements as described in the [ESF Measurement Data](#) section. One [UBX-ESF-RAW](#) message can contain multiple samples from the same sensor. The user can separate and order these using the time tags attached to each of the measurements.

The measurements are made at a fixed rate. The sampling rate or other sensor configuration options can not be changed.

To turn on this feature the [UBX-ESF-RAW](#) message must be enabled using [UBX-CFG-MSG](#). If non-zero rate is selected the message will be output but the selected rate does not otherwise have an influence at the rate of the messages.

Turning on this feature does not disable sensor fusion in the receiver. To use an external fusion algorithm consider disabling the automotive dead reckoning mode using [UBX-CFG-NAVX5](#).

28.3.6 Receiver Startup and Shutdown

Continuous dead reckoning is possible over receiver restarts if the following conditions are true:

- The vehicle is not moved while the receiver is off

During periods of external sensor data unavailability the receiver switches to GNSS-only navigation if the last sensor information indicated the vehicle was moving.

29 High Navigation Rate (HNR)

This feature is only available with the [ADR](#) products.

This feature is only available with the [UDR](#) products.

29.1 Introduction

u-blox DR solutions allow a low latency position and velocity to be output at up to 30 Hz. The maximum GNSS rate is 2 Hz. Sensors measurements are used to propagate the solution at the higher rate between GNSS epochs.

The high navigation rate solution is output using the [UBX-HNR-PVT](#) message for firmwares using [protocol version 19+](#).

29.2 Configuration

The high navigation rate output can be configured using the [UBX-CFG-HNR](#) message.

If a high navigation rate has been configured with [UBX-CFG-HNR](#) then the number of enabled output messages must be adjusted to keep within the maximum throughput of the interface used.

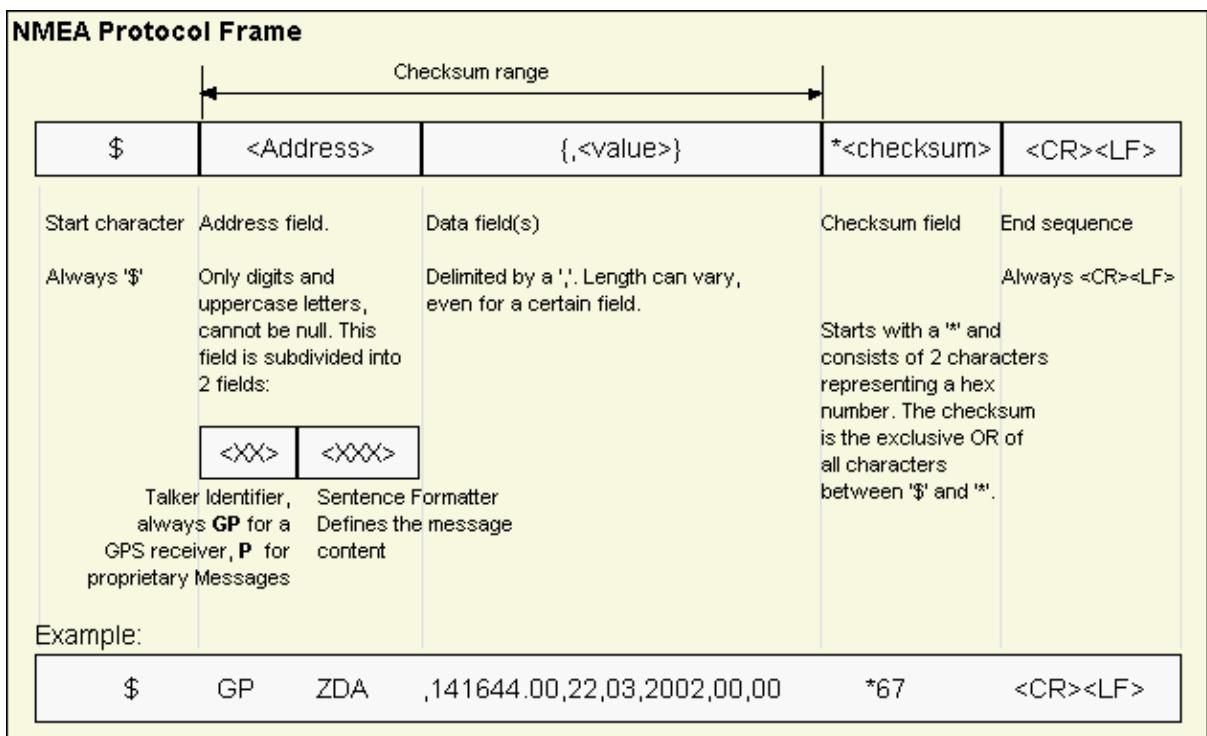

Protocol Specification

30 NMEA Protocol

30.1 Protocol Overview

30.1.1 Message Format

NMEA messages sent by the GNSS receiver are based on NMEA 0183 Version 4.0. The following picture shows the structure of a NMEA protocol message.

For further information on the NMEA Standard, refer to *NMEA 0183 Standard For Interfacing Marine Electronic Devices*, Version 4.00, November 1, 2008. See <http://www.nmea.org/> for ordering instructions.

The NMEA standard allows for proprietary, manufacturer-specific messages to be added. These shall be marked with a manufacturer mnemonic. The mnemonic assigned to u-blox is UBX and is used for all non-standard messages. These proprietary NMEA messages therefore have the address field set to PUBX. The first data field in a PUBX message identifies the message number with two digits.

30.1.2 Talker ID

One of the ways the NMEA standard differentiates between GNSS is by using a two-letter message identifier, the 'Talker ID'. The specific Talker ID used by a u-blox receiver will depend on the device model and system configuration. The table below shows the Talker ID that will be used for various GNSS configurations.

NMEA Talker IDs

| Configured GNSS | Talker ID |
|-----------------|-----------|
| GPS, SBAS, QZSS | GP |
| GLONASS | GL |
| Galileo | GA |

NMEA Talker IDs continued

| Configured GNSS | Talker ID |
|-------------------------|-----------|
| BeiDou | GB |
| Any combination of GNSS | GN |

30.1.3 Protocol Configuration

The [NMEA protocol](#) on u-blox receivers can be configured to the need of customer applications using [CFG-NMEA](#). For backwards compatibility various versions of this message are supported, however, any new users should use the version that is not marked as deprecated.

There are four NMEA standards supported. The default NMEA version is 4.0. Alternatively versions 4.1, 2.3, and 2.1 can be enabled (for details on how this affects the output refer to section [Position Fix Flags in NMEA Mode](#)).

Customers using BeiDou and/or Galileo are recommended to select NMEA version 4.1, as earlier versions have no support for these two GNSS.

Customers using High Precision GNSS (HPG) products are recommended to select NMEA version 4.1, as earlier versions do not support the Float RTK (F) and Real Time Kinematic (R) mode indicator flags in all messages.

NMEA defines satellite numbering systems for some, but not all GNSS (this is partly dependent on the NMEA version). Satellite numbers for unsupported GNSS can be configured using [CFG-NMEA](#). Unknown satellite numbers are always reported as a null NMEA field (i.e. an empty string)

The NMEA specification indicates that the GGA message is GPS specific. However, u-blox receivers support the output of a GGA message for each of the Talker IDs.

NMEA filtering flags

| Parameter | Description |
|--------------------------|---|
| Position filtering | Enable to permit positions from failed or invalid fixes to be reported (with the "V" status flag to indicate that the data is not valid). |
| Valid position filtering | Enable to permit positions from invalid fixes to be reported (with the "V" status flag to indicate that the data is not valid). |
| Time filtering | Enable to permit the receiver's best knowledge of time to be output, even though it might be wrong. |
| Date filtering | Enable to permit the receiver's best knowledge of date to be output, even though it might be wrong. |
| GPS-only filtering | Enable to restrict output to only report GPS satellites. |
| Track filtering | Enable to permit course over ground (COG) to be reported even when it would otherwise be frozen. |

NMEA flags

| Parameter | Description |
|--------------------|--|
| Compatibility Mode | Some older NMEA applications expect the NMEA output to be formatted in a specific way, for example, they will only work if the latitude and longitude have exactly four digits behind the decimal point. u-blox receivers offer a compatibility mode to support these legacy applications. |

NMEA flags continued

| Parameter | Description |
|---------------------|---|
| Consideration Mode | u-blox receivers use a sophisticated signal quality detection scheme, in order to produce the best possible position output. This algorithm considers all SV measurements, and may eventually decide to only use a subset thereof, if it improves the overall position accuracy. If Consideration mode is enabled, all satellites, which were considered for navigation, are communicated as being used for the position determination. If Consideration Mode is disabled, only those satellites which after the consideration step remained in the position output are marked as being used. |
| Limit82 Mode | Enabling this mode will limit the NMEA sentence length to a maximum of 82 characters. |
| High Precision Mode | Enabling this mode increases precision of the position output. Latitude and longitude then have seven digits after the decimal point, and altitude has three digits after the decimal point. Note: The High Precision Mode cannot be set in conjunction with either Compatibility Mode or Limit82 Mode. |

Extended configuration

| Option | Description |
|---------------------|--|
| GNSS to filter | Filters satellites based on their GNSS |
| Satellite numbering | This field configures the display of satellites that do not have an NMEA-defined value. Note: this does not apply to satellites with an unknown ID. |
| Main Talker ID | By default the main Talker ID (i.e. the Talker ID used for all messages other than GSV) is determined by the GNSS assignment of the receiver's channels (see UBX-CFG-GNSS). This field enables the main Talker ID to be overridden. |
| GSV Talker ID | By default the Talker ID for GSV messages is GNSS specific (as defined by NMEA). This field enables the GSV Talker ID to be overridden. |
| BDS Talker ID | By default the Talker ID for BeiDou is 'GB'. This field enables the BeiDou Talker ID to be overridden. |

Extra fields in NMEA 4.1 and above

| Message | Extra fields |
|---------|--------------------|
| GBS | systemId, signalId |
| GNS | navStatus |
| GRS | systemId, signalId |
| GSA | systemId |
| GSV | signalId |
| RMC | navStatus |

30.1.4 Satellite Numbering

The NMEA protocol (V4.0) identifies satellites with a two digit number, reserving the numbers 1 to 32 for GPS, 33-64 for SBAS and 65-96 for GLONASS. So, for example, GLONASS SV4 is reported using number 68. u-blox receivers support this method in their NMEA output when "strict" SV numbering is selected. In most cases this is the default setting, but can be checked or set using [UBX-CFG-NMEA](#).

Unfortunately there is currently no standard way of identifying satellites from any other GNSS within the NMEA protocol. In order to support QZSS within current receivers and prepare for support of other systems (e.g. Galileo) in future receivers, an "extended" SV numbering scheme can be enabled (using [UBX-CFG-NMEA](#)). This uses the NMEA-defined numbers where possible, but adds other number ranges to support other GNSS. Note however that these non-standard extensions require 3 digit numbers, which may not be supported by some

NMEA parsing software. For example QZSS satellites are reported using numbers in the range 193 to 197.

See [Satellite Numbering Summary](#) for a complete list of satellite numbers.

GLONASS satellites can be tracked before they have been identified. In NMEA output, such unknown satellite numbers are always reported as a null field (i.e. an empty string).

30.1.5 Latitude and Longitude Format

According to the NMEA Standard, Latitude and Longitude are output in the format Degrees, Minutes and (Decimal) Fractions of Minutes. To convert to Degrees and Fractions of Degrees, or Degrees, Minutes, Seconds and Fractions of seconds, the 'Minutes' and 'Fractional Minutes' parts need to be converted. In other words: If the GPS Receiver reports a Latitude of 4717.112671 North and Longitude of 00833.914843 East, this is

Latitude 47 Degrees, 17.112671 Minutes

Longitude 8 Degrees, 33.914843 Minutes

or

Latitude 47 Degrees, 17 Minutes, 6.76026 Seconds

Longitude 8 Degrees, 33 Minutes, 54.89058 Seconds

or

Latitude 47.28521118 Degrees

Longitude 8.56524738 Degrees

30.1.6 Position Fix Flags

This section shows how u-blox implements the NMEA protocol and the conditions determining how flags are set.

Flags in NMEA 4.1 and above

| NMEA Message Field | GLL, RMC status | GGA quality | GLL, VTG posMode | RMC, GNS posMode |
|--|--------------------|----------------|---------------------|---------------------|
| No position fix (at power-up, after losing satellite lock) | V | 0 | N | N |
| GNSS fix, but user limits exceeded | V | 0 | N | N |
| Dead reckoning fix, but user limits exceeded | V | 6 | E | E |
| Dead reckoning fix | A | 6 | E | E |
| RTK float | A | 5 | D | F |
| RTK fixed | A | 4 | D | R |
| 2D GNSS fix | A | 1 / 2 | A / D | A / D |
| 3D GNSS fix | A | 1 / 2 | A / D | A / D |
| Combined GNSS/dead reckoning fix | A | 1 / 2 | A / D | A / D |
| | See below (1) | See below (2) | See below (3) | See below (3) |

(1) Possible values for *status*: V = Data invalid, A = Data valid

(2) Possible values for *quality*: 0 = No fix, 1 = Autonomous GNSS fix, 2 = Differential GNSS fix, 4 = RTK fixed, 5 = RTK float, 6 = Estimated/Dead reckoning fix

(3) Possible values for *posMode*: N = No fix, E = Estimated/Dead reckoning fix, A = Autonomous GNSS fix, D = Differential GNSS fix, F = RTK float, R = RTK fixed

Flags in NMEA 2.3 and above

Flags in NMEA 2.3 and above continued

| NMEA Message | <i>Field</i> | <i>status</i> | GGA | GSA | <i>GLL, VTG, RMC, GNS posMode</i> |
|--|--------------|---------------|---------------|---------------|---|
| NMEA Message | <i>Field</i> | <i>status</i> | GGA | GSA | <i>GLL, VTG, RMC, GNS posMode</i> |
| No position fix (at power-up, after losing satellite lock) | | V | 0 | 1 | N |
| GNSS fix, but user limits exceeded | | V | 0 | 1 | N |
| Dead reckoning fix, but user limits exceeded | | V | 6 | 2 | E |
| Dead reckoning fix | | A | 6 | 2 | E |
| 2D GNSS fix | | A | 1 / 2 | 2 | A / D |

| | | See below (1) | See below (2) | See below (3) | See below (4) |

(1) Possible values for *status*: V = Data invalid, A = Data valid

(2) Possible values for *quality*: 0 = No fix, 1 = Autonomous GNSS fix, 2 = Differential GNSS fix, 4 = RTK fixed, 5 = RTK float, 6 = Estimated/Dead reckoning fix

(3) Possible values for *navMode*: 1 = No fix, 2 = 2D fix, 3 = 3D fix

(4) Possible values for *posMode*: N = No fix, E = Estimated/Dead reckoning fix, A = Autonomous GNSS fix, D = Differential GNSS fix, F = RTK float, R = RTK fixed

Flags in NMEA 2.1 and below

The flags in NMEA 2.1 and below are the same as NMEA 2.3 and above but with the following differences:

- The *posMode* field is not output for GLL, RMC and VTG messages (each message has one field less).
- The GGA *quality* field is set to 1 (instead of 6) for both types of dead reckoning fix.

30.1.7 Multi-GNSS considerations

Many applications which process NMEA messages assume that only a single GNSS is active. However, when multiple GNSS are configured, the NMEA specification requires the output to change in the following ways:

NMEA output for Multi-GNSS

| Change | Description |
|-------------------------------|---|
| Main Talker ID | The main Talker ID will be 'GN' (e.g. instead of 'GP' for a GPS receiver) |
| GSV Talker IDs | The GSV message reports the signal strength of the visible satellites. However, the Talker ID it uses is specific to the GNSS it is reporting information for, so for a multi-GNSS receiver it will not be the same as the main Talker ID. (e.g. other messages will be using the 'GN' Talker ID but the GSV message will use GNSS-specific Talker IDs) |
| Multiple GSA and GRS Messages | Multiple GSA and GRS messages are output for each fix, one for each GNSS. This may confuse applications which assume they are output only once per position fix (as is the case for a single GNSS receiver). |

30.1.8 Output of Invalid/Unknown Data

By default the receiver will not output invalid data. In such cases, it will output empty fields.

A valid position fix is reported as follows:

```
$GPGLL,4717.11634,N,00833.91297,E,124923.00,A,A*6E
```

An invalid position fix (but time valid) is reported as follows:

```
$GPGLL,,,,,124924.00,V,N*42
```

If Time is unknown (e.g. during a cold-start):

```
$GPGLL,,,,,V,N*64
```

Note:

-  An exception from the above default are dead reckoning fixes, which are also output when invalid (user limits exceeded).
-  Output of invalid data marked with the 'Invalid/Valid' Flags can be enabled using the UBX protocol message [CFG-NMEA](#).
-  Differing from the NMEA standard, u-blox reports valid dead reckoning fixes with user limits met (not exceeded) as valid (A) instead of invalid (V).

30.1.9 Messages Overview

When configuring NMEA messages using the UBX protocol message [CFG-MSG](#), the Class/Ids shown in the table shall be used.

| Page | Mnemonic | Cls/ID | Description |
|-------------------------------|------------------------|-----------------------------|--|
| NMEA Standard Messages | | Standard Messages | |
| 110 | DTM | 0xF0 0x0A | Datum Reference |
| 111 | GBQ | 0xF0 0x44 | Poll a standard message (if the current Talker ID is GB) |
| 111 | GBS | 0xF0 0x09 | GNSS Satellite Fault Detection |
| 112 | GGA | 0xF0 0x00 | Global positioning system fix data |
| 114 | GLL | 0xF0 0x01 | Latitude and longitude, with time of position fix and status |
| 115 | GLQ | 0xF0 0x43 | Poll a standard message (if the current Talker ID is GL) |
| 115 | GNQ | 0xF0 0x42 | Poll a standard message (if the current Talker ID is GN) |
| 116 | GNS | 0xF0 0x0D | GNSS fix data |
| 117 | GPQ | 0xF0 0x40 | Poll a standard message (if the current Talker ID is GP) |
| 117 | GRS | 0xF0 0x06 | GNSS Range Residuals |
| 118 | GSA | 0xF0 0x02 | GNSS DOP and Active Satellites |
| 119 | GST | 0xF0 0x07 | GNSS Pseudo Range Error Statistics |
| 120 | GSV | 0xF0 0x03 | GNSS Satellites in View |
| 121 | RMC | 0xF0 0x04 | Recommended Minimum data |
| 122 | TXT | 0xF0 0x41 | Text Transmission |
| 123 | VLW | 0xF0 0x0F | Dual ground/water distance |
| 124 | VTG | 0xF0 0x05 | Course over ground and Ground speed |
| 125 | ZDA | 0xF0 0x08 | Time and Date |
| NMEA PUBX Messages | | Proprietary Messages | |
| 126 | CONFIG | 0xF1 0x41 | Set Protocols and Baudrate |

NMEA Messages Overview continued

| Page | Mnemonic | Class/ID | Description |
|------|-----------------|-----------|-----------------------------------|
| 127 | POSITION | 0xF1 0x00 | Lat/Long Position Data |
| 128 | RATE | 0xF1 0x40 | Set NMEA message output rate |
| 129 | SVSTATUS | 0xF1 0x03 | Satellite Status |
| 130 | TIME | 0xF1 0x04 | Time of Day and Clock Information |

30.2 Standard Messages

Standard Messages: i.e. Messages as defined in the NMEA Standard.

30.2.1 DTM

30.2.1.1 Datum Reference

| | | | |
|---------------------|--|-------------------------|--|
| <i>Message</i> | DTM | | |
| <i>Description</i> | Datum Reference | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| <i>Type</i> | Output Message | | |
| <i>Comment</i> | This message gives the difference between the current datum and the reference datum. The current datum defaults to WGS84 The reference datum cannot be changed and is always set to WGS84. | | |
| | <i>ID for CFG-MSG</i> | <i>Number of fields</i> | |
| <i>Message Info</i> | 0xF0 0x0A | 11 | |

Message Structure:

```
$xxDTM,datum,subDatum,lat,NS,lon,EW,alt,refDatum*cs<CR><LF>
```

Example:

```
$GPDTM,W84,,0.0,N,0.0,E,0.0,W84*6F
```

```
$GPDTM,999,,0.08,N,0.07,E,-47.7,W84*1C
```

| <i>Field No.</i> | <i>Name</i> | <i>Unit</i> | <i>Format</i> | <i>Example</i> | <i>Description</i> |
|------------------|-------------|-------------|---------------|----------------|---|
| 0 | xxDTM | - | string | \$GPDTM | DTM Message ID (xx = current Talker ID) |
| 1 | datum | - | string | W84 | Local datum code: W84 = WGS84, 999 = user defined |
| 2 | subDatum | - | string | - | A null field |
| 3 | lat | min | numeric | 0.08 | Offset in Latitude |
| 4 | NS | - | character | S | North/South indicator |
| 5 | lon | min | numeric | 0.07 | Offset in Longitude |
| 6 | EW | - | character | E | East/West indicator |
| 7 | alt | m | numeric | -2.8 | Offset in altitude |
| 8 | refDatum | - | string | W84 | Reference datum code (always W84 = WGS 84) |
| 9 | cs | - | hexadecimal | *67 | Checksum |
| 10 | <CR><LF> | - | character | - | Carriage return and line feed |

30.2.2 GBQ

30.2.2.1 Poll a standard message (if the current Talker ID is GB)

| | | | |
|--------------|--|------------------|--|
| Message | GBQ | | |
| Description | Poll a standard message (if the current Talker ID is GB) | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Input Message | | |
| Comment | Polls a standard NMEA message if the current Talker ID is GB | | |
| Message Info | ID for CFG-MSG | Number of fields | |
| | 0xF0 0x44 | 4 | |

Message Structure:

```
$xxGBQ, msgId*cs<CR><LF>
```

Example:

```
$EIGBQ,RMC*28
```

| Field No. | Name | Unit | Format | Example | Description |
|-----------|----------|------|-------------|---------|---|
| 0 | xxGBQ | - | string | \$EIGBQ | GBQ Message ID (xx = Talker ID of the device requesting the poll) |
| 1 | msgId | - | string | RMC | Message ID of the message to be polled |
| 2 | cs | - | hexadecimal | *28 | Checksum |
| 3 | <CR><LF> | - | character | - | Carriage return and line feed |

30.2.3 GBS

30.2.3.1 GNSS Satellite Fault Detection

| | | | |
|--------------|--|------------------|--|
| Message | GBS | | |
| Description | GNSS Satellite Fault Detection | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Output Message | | |
| Comment | <p>This message outputs the results of the Receiver Autonomous Integrity Monitoring Algorithm (RAIM).</p> <ul style="list-style-type: none"> The fields errLat, errLon and errAlt output the standard deviation of the position calculation, using all satellites which pass the RAIM test successfully. The fields errLat, errLon and errAlt are only output if the RAIM process passed successfully (i.e. no or successful edits happened). These fields are never output if 4 or fewer satellites are used for the navigation calculation (because, in such cases, integrity can not be determined by the receiver autonomously). The fields prob, bias and stddev are only output if at least one satellite failed in the RAIM test. If more than one satellites fail the RAIM test, only the information for the worst satellite is output in this message. | | |
| Message Info | ID for CFG-MSG | Number of fields | |
| | 0xF0 0x09 | 13 | |

Message Structure:

```
$xxGBS,time,errLat,errLon,errAlt,svid,prob,bias,stddev,systemId,signalId*cs<CR><LF>
```

Example:

```
$GPGBS,235503.00,1.6,1.4,3.2,,,*40
$GPGBS,235458.00,1.4,1.3,3.1,03,-21.4,3.8,1,0*5B
```

| Field No. | Name | Unit | Format | Example | Description |
|-----------|----------|------|-------------|-----------|--|
| 0 | xxGBS | - | string | \$GPGBS | GBS Message ID (xx = current Talker ID) |
| 1 | time | - | hhmmss.ss | 235503.00 | UTC time to which this RAIM sentence belongs, see note on UTC representation |
| 2 | errLat | m | numeric | 1.6 | Expected error in latitude |
| 3 | errLon | m | numeric | 1.4 | Expected error in longitude |
| 4 | errAlt | m | numeric | 3.2 | Expected error in altitude |
| 5 | svid | - | numeric | 03 | Satellite ID of most likely failed satellite |
| 6 | prob | - | numeric | - | Probability of missed detection, not supported (empty) |
| 7 | bias | m | numeric | -21.4 | Estimate on most likely failed satellite (a priori residual) |
| 8 | stddev | m | numeric | 3.8 | Standard deviation of estimated bias |
| 9 | systemId | - | numeric | 1 | NMEA defined GNSS System ID NMEA v4.1 and above only |
| 10 | signalId | - | numeric | 0 | NMEA defined GNSS Signal ID (0 = All signals) NMEA v4.1 and above only |
| 11 | cs | - | hexadecimal | *5B | Checksum |
| 12 | <CR><LF> | - | character | - | Carriage return and line feed |

30.2.4 GGA

30.2.4.1 Global positioning system fix data

| | | | |
|--------------|---|------------------|--|
| Message | GGA | | |
| Description | Global positioning system fix data | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Output Message | | |
| Comment | The output of this message is dependent on the currently selected datum (default: WGS84). The NMEA specification indicates that the GGA message is GPS specific. However, when the receiver is configured for multi-GNSS, the GGA message contents will be generated from the multi-GNSS solution. For multi-GNSS use, it is recommended that the NMEA-GNS message is used instead. Time and position, together with GPS fixing related data (number of satellites in use, and the resulting HDOP, age of differential data if in use, etc.). | | |
| Message Info | ID for CFG-MSG | Number of fields | |
| | 0xF0 0x00 | 17 | |

Message Structure:

```
$xxGGA,time,lat,NS,long,EW,quality,numSV,HDOP,alt,M,sep,M,diffAge,diffStation*cs<CR><LF>
```

Example:

```
$GPGGA,092725.00,4717.11399,N,00833.91590,E,1,08,1.01,499.6,M,48.0,M,,*5B
```

GGA continued

| Field No. | Name | Unit | Format | Example | Description |
|-----------|-------------|------|-----------------|-------------|--|
| Field No. | Name | Unit | Format | Example | Description |
| 0 | xxGGA | - | string | \$GP GGA | GGA Message ID (xx = current Talker ID) |
| 1 | time | - | hhmmss.ss | 092725.00 | UTC time, see note on UTC representation |
| 2 | lat | - | ddmm. mmmmm | 4717.11399 | Latitude (degrees & minutes), see format description |
| 3 | NS | - | character | N | North/South indicator |
| 4 | long | - | dddmm. mmmmm | 00833.91590 | Longitude (degrees & minutes), see format description |
| 5 | EW | - | character | E | East/West indicator |
| 6 | quality | - | digit | 1 | Quality indicator for position fix, see table below and position fix flags description |
| 7 | numSV | - | numeric | 08 | Number of satellites used (range: 0-12) |
| 8 | HDOP | - | numeric | 1.01 | Horizontal Dilution of Precision |
| 9 | alt | m | numeric | 499.6 | Altitude above mean sea level |
| 10 | uAlt | - | character | M | Altitude units: meters (fixed field) |
| 11 | sep | m | numeric | 48.0 | Geoid separation: difference between ellipsoid and mean sea level |
| 12 | uSep | - | character | M | Separation units: meters (fixed field) |
| 13 | diffAge | s | numeric | - | Age of differential corrections (blank when DGPS is not used) |
| 14 | diffStation | - | numeric | - | ID of station providing differential corrections (blank when DGPS is not used) |
| 15 | cs | - | hexadecimal | *5B | Checksum |
| 16 | <CR><LF> | - | character | - | Carriage return and line feed |

Table Quality Indicator

| Quality Indicator | Description, see also position fix flags description |
|-------------------|--|
| 0 | No Fix / Invalid |
| 1 | Standard GPS (2D/3D) |
| 2 | Differential GPS |
| 4 | RTK fixed solution |
| 5 | RTK float solution |
| 6 | Estimated (DR) Fix |

30.2.5 GLL

30.2.5.1 Latitude and longitude, with time of position fix and status

| | | | |
|--------------|--|------------------|--|
| Message | GLL | | |
| Description | Latitude and longitude, with time of position fix and status | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Output Message | | |
| Comment | The output of this message is dependent on the currently selected datum (default: WGS84) - | | |
| Message Info | ID for CFG-MSG | Number of fields | |
| | 0xF0 0x01 | 10 | |

Message Structure:

```
$xxGLL,lat,NS,long,EW,time,status,posMode*cs<CR><LF>
```

Example:

```
$GPGLL,4717.11364,N,00833.91565,E,092321.00,A,A*60
```

| Field No. | Name | Unit | Format | Example | Description |
|-----------|----------|------|-----------------|-------------|---|
| 0 | xxGLL | - | string | \$GPGLL | GLL Message ID (xx = current Talker ID) |
| 1 | lat | - | ddmm. mmmmm | 4717.11364 | Latitude (degrees & minutes), see format description |
| 2 | NS | - | character | N | North/South indicator |
| 3 | long | - | dddmm. mmmmm | 00833.91565 | Longitude (degrees & minutes), see format description |
| 4 | EW | - | character | E | East/West indicator |
| 5 | time | - | hhmmss.ss | 092321.00 | UTC time, see note on UTC representation |
| 6 | status | - | character | A | V = Data invalid or receiver warning, A = Data valid. See position fix flags description . |
| 7 | posMode | - | character | A | Positioning mode, see position fix flags description . NMEA v2.3 and above only |
| 8 | cs | - | hexadecimal | *60 | Checksum |
| 9 | <CR><LF> | - | character | - | Carriage return and line feed |

30.2.6 GLQ

30.2.6.1 Poll a standard message (if the current Talker ID is GL)

| | | | |
|--------------|--|------------------|--|
| Message | GLQ | | |
| Description | Poll a standard message (if the current Talker ID is GL) | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Input Message | | |
| Comment | Polls a standard NMEA message if the current Talker ID is GL | | |
| Message Info | ID for CFG-MSG | Number of fields | |
| | 0xF0 0x43 | 4 | |

Message Structure:

```
$xxGLQ, msgId*cs<CR><LF>
```

Example:

```
$EIGLQ, RMC*3A
```

| Field No. | Name | Unit | Format | Example | Description |
|-----------|----------|------|-------------|---------|---|
| 0 | xxGLQ | - | string | \$EIGLQ | GLQ Message ID (xx = Talker ID of the device requesting the poll) |
| 1 | msgId | - | string | RMC | Message ID of the message to be polled |
| 2 | cs | - | hexadecimal | *3A | Checksum |
| 3 | <CR><LF> | - | character | - | Carriage return and line feed |

30.2.7 GNQ

30.2.7.1 Poll a standard message (if the current Talker ID is GN)

| | | | |
|--------------|--|------------------|--|
| Message | GNQ | | |
| Description | Poll a standard message (if the current Talker ID is GN) | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Input Message | | |
| Comment | Polls a standard NMEA message if the current Talker ID is GN | | |
| Message Info | ID for CFG-MSG | Number of fields | |
| | 0xF0 0x42 | 4 | |

Message Structure:

```
$xxGNQ, msgId*cs<CR><LF>
```

Example:

```
$EIGNQ, RMC*3A
```

| Field No. | Name | Unit | Format | Example | Description |
|-----------|----------|------|-------------|---------|---|
| 0 | xxGNQ | - | string | \$EIGNQ | GNQ Message ID (xx = Talker ID of the device requesting the poll) |
| 1 | msgId | - | string | RMC | Message ID of the message to be polled |
| 2 | cs | - | hexadecimal | *3A | Checksum |
| 3 | <CR><LF> | - | character | - | Carriage return and line feed |

30.2.8 GNS

30.2.8.1 GNSS fix data

| | | | |
|--------------|---|------------------|--|
| Message | GNS | | |
| Description | GNSS fix data | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Output Message | | |
| Comment | The output of this message is dependent on the currently selected datum (default: WGS84) Time and position, together with GNSS fixing related data (number of satellites in use, and the resulting HDOP, age of differential data if in use, etc.). | | |
| Message Info | ID for CFG-MSG | Number of fields | |
| | 0xF0 0x0D | 16 | |

Message Structure:

```
$xxGNS,time,lat,NS,long,EW,posMode,numSV,HDOP,alt,altRef,diffAge,diffStation,navStatus*cs<CR><LF>
```

Example:

```
$GPGNS,091547.00,5114.50897,N,00012.28663,W,AA,10,0.83,111.1,45.6,,,V*71
```

| Field No. | Name | Unit | Format | Example | Description |
|-----------|-------------|------|-----------------|-------------|---|
| 0 | xxGNS | - | string | \$GPGNS | GNS Message ID (xx = current Talker ID) |
| 1 | time | - | hhmmss.ss | 091547.00 | UTC time, see note on UTC representation |
| 2 | lat | - | ddmm. mmmmm | 5114.50897 | Latitude (degrees & minutes), see format description |
| 3 | NS | - | character | N | North/South indicator |
| 4 | long | - | dddmm. mmmmm | 00012.28663 | Longitude (degrees & minutes), see format description |
| 5 | EW | - | character | E | East/West indicator |
| 6 | posMode | - | character | AA | Positioning mode, see position fix flags description . First character for GPS, second character for GLONASS |
| 7 | numSV | - | numeric | 10 | Number of satellites used (range: 0-99) |
| 8 | HDOP | - | numeric | 0.83 | Horizontal Dilution of Precision |
| 9 | alt | m | numeric | 111.1 | Altitude above mean sea level |
| 10 | sep | m | numeric | 45.6 | Geoid separation: difference between ellipsoid and mean sea level |
| 11 | diffAge | s | numeric | - | Age of differential corrections (blank when DGPS is not used) |
| 12 | diffStation | - | numeric | - | ID of station providing differential corrections (blank when DGPS is not used) |
| 13 | navStatus | - | character | V | Navigational status indicator (V = Equipment is not providing navigational status information) NMEA v4.1 and above only |
| 14 | cs | - | hexadecimal | *71 | Checksum |
| 15 | <CR><LF> | - | character | - | Carriage return and line feed |

30.2.9 GPQ

30.2.9.1 Poll a standard message (if the current Talker ID is GP)

| | | | |
|--------------|--|------------------|--|
| Message | GPQ | | |
| Description | Poll a standard message (if the current Talker ID is GP) | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Input Message | | |
| Comment | Polls a standard NMEA message if the current Talker ID is GP | | |
| Message Info | ID for CFG-MSG | Number of fields | |
| | 0xF0 0x40 | 4 | |

Message Structure:

```
$xxGPQ, msgId*cs<CR><LF>
```

Example:

```
$EIGPQ, RMC*3A
```

| Field No. | Name | Unit | Format | Example | Description |
|-----------|----------|------|-------------|---------|---|
| 0 | xxGPQ | - | string | \$EIGPQ | GPQ Message ID (xx = Talker ID of the device requesting the poll) |
| 1 | msgId | - | string | RMC | Message ID of the message to be polled |
| 2 | cs | - | hexadecimal | *3A | Checksum |
| 3 | <CR><LF> | - | character | - | Carriage return and line feed |

30.2.10 GRS

30.2.10.1 GNSS Range Residuals

| | | | |
|--------------|---|------------------|--|
| Message | GRS | | |
| Description | GNSS Range Residuals | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Output Message | | |
| Comment | This messages relates to associated GGA and GSA messages. If less than 12 SVs are available, the remaining fields are output empty. If more than 12 SVs are used, only the residuals of the first 12 SVs are output, in order to remain consistent with the NMEA standard. In a multi-GNSS system this message will be output multiple times, once for each GNSS. | | |
| Message Info | ID for CFG-MSG | Number of fields | |
| | 0xF0 0x06 | 19 | |

Message Structure:

```
$xxGRS, time, mode {, residual}, systemId, signalId*cs<CR><LF>
```

Example:

```
$GPGRS,082632.00,1,0.54,0.83,1.00,1.02,-2.12,2.64,-0.71,-1.18,0.25,,,1,0*70
```

| Field No. | Name | Unit | Format | Example | Description |
|-----------|-------|------|--------|---------|---|
| 0 | xxGRS | - | string | \$GPGRS | GRS Message ID (xx = current Talker ID) |

GRS continued

| Field No. | Name | Unit | Format | Example | Description |
|---|----------|------|-------------|-----------|---|
| 1 | time | - | hhmmss.ss | 082632.00 | UTC time of associated position fix, see note on UTC representation |
| 2 | mode | - | digit | 1 | Mode (see table below), u-blox receivers will always output Mode 1 residuals |
| <i>Start of repeated block (12 times)</i> | | | | | |
| 3 + 1*N | residual | m | numeric | 0.54 | Range residuals for SVs used in navigation. The SV order matches the order from the GSA sentence. |
| <i>End of repeated block</i> | | | | | |
| 15 | systemId | - | numeric | 1 | NMEA defined GNSS System ID NMEA v4.1 and above only |
| 16 | signalId | - | numeric | 0 | NMEA defined GNSS Signal ID (0 = All signals) NMEA v4.1 and above only |
| 17 | cs | - | hexadecimal | *70 | Checksum |
| 18 | <CR><LF> | - | character | - | Carriage return and line feed |

Table Mode

| Mode | Description |
|------|---|
| 0 | Residuals were used to calculate the position given in the matching GGA sentence. |
| 1 | Residuals were recomputed after the GGA position was computed. |

30.2.11 GSA

30.2.11.1 GNSS DOP and Active Satellites

| | | | |
|--------------|---|------------------|--|
| Message | GSA | | |
| Description | GNSS DOP and Active Satellites | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Output Message | | |
| Comment | The GNSS receiver operating mode, satellites used for navigation, and DOP values. <ul style="list-style-type: none"> If less than 12 SVs are used for navigation, the remaining fields are left empty. If more than 12 SVs are used for navigation, only the IDs of the first 12 are output. The SV numbers (fields 'sv') are in the range of 1 to 32 for GPS satellites, and 33 to 64 for SBAS satellites (33 = SBAS PRN 120, 34 = SBAS PRN 121, and so on) In a multi-GNSS system this message will be output multiple times, once for each GNSS. | | |
| Message Info | ID for CFG-MSG | Number of fields | |

| 7.. 16 | <CR><LF> | - | character | - | Carriage return and line feed |

30.2.14 RMC

30.2.14.1 Recommended Minimum data

| | | | |
|--------------|---|------------------|--|
| Message | RMC | | |
| Description | Recommended Minimum data | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Output Message | | |
| Comment | The output of this message is dependent on the currently selected datum (default: WGS84) The recommended minimum sentence defined by NMEA for GNSS system data. | | |
| Message Info | ID for CFG-MSG | Number of fields | |
| | 0xF0 0x04 | 16 | |

Message Structure:

```
$xxRMC,time,status,lat,NS,long,EW,spd,cog,date,mv,mvEW,posMode,navStatus*cs<CR><LF>
```

Example:

```
$GPRMC,083559.00,A,4717.11437,N,00833.91522,E,0.004,77.52,091202,,,A,V*57
```

| Field No. | Name | Unit | Format | Example | Description |
|-----------|--------|------|----------------|------------|---|
| 0 | xxRMC | - | string | \$GPRMC | RMC Message ID (xx = current Talker ID) |
| 1 | time | - | hhmmss.ss | 083559.00 | UTC time, see note on UTC representation |
| 2 | status | - | character | A | Status, V = Navigation receiver warning, A = Data valid, see position fix flags description |
| 3 | lat | - | ddmm. mmmmm | 4717.11437 | Latitude (degrees & minutes), see format description |
| 4 | NS | - | character | N | North/South indicator |

RMC continued

| Field No. | Name | Unit | Format | Example | Description |
|-----------|---------------|-------------|-----------------|-------------|---|
| 5 | long | - | dddmm. mmmmm | 00833.91522 | Longitude (degrees & minutes), see format description |
| 6 | EW | - | character | E | East/West indicator |
| 7 | spd | knot s | numeric | 0.004 | Speed over ground |
| 8 | cog | degr ees | numeric | 77.52 | Course over ground |
| 9 | date | - | ddmmyy | 091202 | Date in day, month, year format, see note on UTC representation |
| 10 | mv | degr ees | numeric | - | Magnetic variation value. Only supported in ADR 4.10 and above. |
| 11 | mvEW | - | character | - | Magnetic variation E/W indicator. Only supported in ADR 4.10 and above. |
| 12 | posMode | - | character | A | Mode Indicator, see position fix flags description NMEA v2.3 and above only |
| 13 | navStatu s | - | character | V | Navigational status indicator (V = Equipment is not providing navigational status information) NMEA v4.1 and above only |
| 14 | cs | - | hexadecimal | *57 | Checksum |
| 15 | <CR><LF> | - | character | - | Carriage return and line feed |

30.2.15 TXT

30.2.15.1 Text Transmission

| | | | |
|--------------|---|------------------|--|
| Message | TXT | | |
| Description | Text Transmission | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Output Message | | |
| Comment | This message is not configured through UBX-CFG-MSG, but instead through UBX-CFG-INF. This message outputs various information on the receiver, such as power-up screen, software version etc. This message can be configured using UBX Protocol message UBX-CFG-INF . | | |
| Message Info | ID for CFG-MSG | Number of fields | |
| | 0xF0 0x41 | 7 | |

Message Structure:

```
$xxTXT, numMsg, msgNum, msgType, text *cs<CR><LF>
```

Example:

```
$GPTXT,01,01,02,u-blox ag - www.u-blox.com*50
$GPTXT,01,01,02,ANTARIS ATR0620 HW 00000040*67
```

| Field No. | Name | Unit | Format | Example | Description |
|-----------|------|------|--------|---------|-------------|
| | | | | | |

TXT continued

| Field No. | Name | Unit | Format | Example | Description |
|-----------|----------|------|-------------|----------------|---|
| 0 | xxTXT | - | string | \$GPTXT | TXT Message ID (xx = current Talker ID) |
| 1 | numMsg | - | numeric | 01 | Total number of messages in this transmission, 01..99 |
| 2 | msgNum | - | numeric | 01 | Message number in this transmission, range 01..xx |
| 3 | msgType | - | numeric | 02 | Text identifier, u-blox receivers specify the type of the message with this number. 00: Error 01: Warning 02: Notice 07: User |
| 4 | text | - | string | www.u-blox.com | Any ASCII text |
| 5 | cs | - | hexadecimal | *67 | Checksum |
| 6 | <CR><LF> | - | character | - | Carriage return and line feed |

30.2.16 VLW

30.2.16.1 Dual ground/water distance

| Message | VLW | | |
|--------------|---|------------------|----|
| Description | Dual ground/water distance | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Output Message | | |
| Comment | The distance traveled, relative to the water and over the ground. This message relates to the Odometer functionality. | | |
| Message Info | ID for CFG-MSG | Number of fields | |
| | 0xFO | 0x0F | 11 |

Message Structure:

```
$xxVLW,twd,twdUnit,wd,wdUnit,tgd,tgdUnit,gd,gdUnit*cs<CR><LF>
```

Example:

```
$GPVLW,,N,,N,15.8,N,1.2,N*06
```

| Field No. | Name | Unit | Format | Example | Description |
|-----------|----------|------|-------------|---------|---|
| 0 | xxVLW | - | string | \$GPVLW | VLW Message ID (xx = current Talker ID) |
| 1 | twd | nm | numeric | - | Total cumulative water distance, not output |
| 2 | twdUnit | - | character | N | Fixed field: nautical miles |
| 3 | wd | nm | numeric | - | Water distance since reset, not output |
| 4 | wdUnit | - | character | N | Fixed field: nautical miles |
| 5 | tgd | nm | numeric | 15.8 | Total cumulative ground distance |
| 6 | tgdUnit | - | character | N | Fixed field: nautical miles |
| 7 | gd | nm | numeric | 1.2 | Ground distance since reset |
| 8 | gdUnit | - | character | N | Fixed field: nautical miles |
| 9 | cs | - | hexadecimal | *06 | Checksum |
| 10 | <CR><LF> | - | character | - | Carriage return and line feed |

30.2.17 VTG

30.2.17.1 Course over ground and Ground speed

| | | | |
|--------------|--|------------------|--|
| Message | VTG | | |
| Description | Course over ground and Ground speed | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Output Message | | |
| Comment | Velocity is given as Course over Ground (COG) and Speed over Ground (SOG). | | |
| Message Info | ID for CFG-MSG | Number of fields | |
| | 0xF0 0x05 | 12 | |

Message Structure:

```
$xxVTG,cogt,T,cogm,M,knots,N,kph,K,posMode*cs<CR><LF>
```

Example:

```
$GPVTG,77.52,T,,M,0.004,N,0.008,K,A*06
```

| Field No. | Name | Unit | Format | Example | Description |
|-----------|----------|---------|-------------|---------|---|
| 0 | xxVTG | - | string | \$GPVTG | VTG Message ID (xx = current Talker ID) |
| 1 | cogt | degrees | numeric | 77.52 | Course over ground (true) |
| 2 | T | - | character | T | Fixed field: true |
| 3 | cogm | degrees | numeric | - | Course over ground (magnetic). Only supported in ADR 4.10 and above. |
| 4 | M | - | character | M | Fixed field: magnetic |
| 5 | knots | knots | numeric | 0.004 | Speed over ground |
| 6 | N | - | character | N | Fixed field: knots |
| 7 | kph | km/h | numeric | 0.008 | Speed over ground |
| 8 | K | - | character | K | Fixed field: kilometers per hour |
| 9 | posMode | - | character | A | Mode Indicator, see position fix flags description NMEA v2.3 and above only |
| 10 | cs | - | hexadecimal | *06 | Checksum |
| 11 | <CR><LF> | - | character | - | Carriage return and line feed |

30.2.18 ZDA

30.2.18.1 Time and Date

| | | | |
|--------------|--|------------------|---|
| Message | ZDA | | |
| Description | Time and Date | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Output Message | | |
| Comment | - | | |
| Message Info | ID for CFG-MSG | Number of fields | |
| | 0xF0 | 0x08 | 9 |

Message Structure:

```
$xxZDA, hhmmss.ss, day, month, year, ltzh, ltzn*cs<CR><LF>
```

Example:

```
$GPZDA,082710.00,16,09,2002,00,00*64
```

| Field No. | Name | Unit | Format | Example | Description |
|-----------|----------|--------|-------------|-----------|--|
| 0 | xxZDA | - | string | \$GPZDA | ZDA Message ID (xx = current Talker ID) |
| 1 | time | - | hhmmss.ss | 082710.00 | UTC Time, see note on UTC representation |
| 2 | day | day | dd | 16 | UTC day (range: 1-31) |
| 3 | month | mon th | mm | 09 | UTC month (range: 1-12) |
| 4 | year | year | yyyy | 2002 | UTC year |
| 5 | ltzh | - | -xx | 00 | Local time zone hours (fixed to 00) |
| 6 | ltzn | - | zz | 00 | Local time zone minutes (fixed to 00) |
| 7 | cs | - | hexadecimal | *64 | Checksum |
| 8 | <CR><LF> | - | character | - | Carriage return and line feed |

30.3 PUBX Messages

Proprietary Messages: i.e. Messages defined by u-blox.

30.3.1 CONFIG (PUBX,41)

30.3.1.1 Set Protocols and Baudrate

| | | | |
|---------------------|--|-------------------------|--|
| <i>Message</i> | CONFIG | | |
| <i>Description</i> | Set Protocols and Baudrate | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| <i>Type</i> | Set Message | | |
| <i>Comment</i> | - | | |
| <i>Message Info</i> | <i>ID for CFG-MSG</i> | <i>Number of fields</i> | |
| | 0xF1 0x41 | 9 | |

Message Structure:

```
$PUBX,41,portId,inProto,outProto,baudrate,autobaunding*cs<CR><LF>
```

Example:

```
$PUBX,41,1,0007,0003,19200,0*25
```

| <i>Field No.</i> | <i>Name</i> | <i>Unit</i> | <i>Format</i> | <i>Example</i> | <i>Description</i> |
|------------------|--------------|-------------|---------------|----------------|---|
| 0 | \$PUBX | - | string | \$PUBX | Message ID, UBX protocol header, proprietary sentence |
| 1 | msgId | - | numeric | 41 | Proprietary message identifier |
| 2 | portId | - | numeric | 1 | ID of communication port. For a list of port IDs see Serial Communication Ports Description . |
| 3 | inProto | - | hexadecimal | 0007 | Input protocol mask. Bitmask, specifying which protocols(s) are allowed for input. For details see corresponding field in UBX-CFG-PRT . |
| 4 | outProto | - | hexadecimal | 0003 | Output protocol mask. Bitmask, specifying which protocols(s) are allowed for output. For details see corresponding field in UBX-CFG-PRT . |
| 5 | baudrate | bits/s | numeric | 19200 | Baudrate |
| 6 | autobaunding | - | numeric | 0 | Autobaunding: 1=enable, 0=disable (not supported on u-blox 5, set to 0) |
| 7 | cs | - | hexadecimal | *25 | Checksum |
| 8 | <CR><LF> | - | character | - | Carriage return and line feed |

30.3.2 POSITION (PUBX,00)

30.3.2.1 Lat/Long Position Data

| | | | |
|--------------|---|------------------|--|
| Message | POSITION | | |
| Description | Lat/Long Position Data | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Output Message | | |
| Comment | The output of this message is dependent on the currently selected datum (default: WGS84) This message contains position solution data. The datum selection may be changed using the message UBX-CFG-DAT . | | |
| Message Info | ID for CFG-MSG | Number of fields | |
| | 0xF1 | 23 | |

Message Structure:

```
$PUBX,00,time,lat,NS,long,EW,altRef,navStat,hAcc,vAcc,SOG,COG,vVel,diffAge,HDOP,VDOP,TDOP,numSvs,re  
served,DR,*cs<CR><LF>
```

Example:

```
$PUBX,00,081350.00,4717.113210,N,00833.915187,E,546.589,G3,2.1,2.0,0.007,77.52,0.007,,0.92,1.19,0.7  
7,9,0,0*5F
```

| Field No. | Name | Unit | Format | Example | Description |
|-----------|---------|----------|-----------------|--------------|---|
| 0 | \$PUBX | - | string | \$PUBX | Message ID, UBX protocol header, proprietary sentence |
| 1 | msgId | - | numeric | 00 | Proprietary message identifier: 00 |
| 2 | time | - | hhmmss.ss | 081350.00 | UTC time, see note on UTC representation |
| 3 | lat | - | ddmm. mmmmm | 4717.113210 | Latitude (degrees & minutes), see format description |
| 4 | NS | - | character | N | North/South Indicator |
| 5 | long | - | dddmm. mmmmm | 00833.915187 | Longitude (degrees & minutes), see format description |
| 6 | EW | - | character | E | East/West indicator |
| 7 | altRef | m | numeric | 546.589 | Altitude above user datum ellipsoid. |
| 8 | navStat | - | string | G3 | Navigation Status, See Table below |
| 9 | hAcc | m | numeric | 2.1 | Horizontal accuracy estimate. |
| 10 | vAcc | m | numeric | 2.0 | Vertical accuracy estimate. |
| 11 | SOG | km/ h | numeric | 0.007 | Speed over ground |
| 12 | COG | deg | numeric | 77.52 | Course over ground |
| 13 | vVel | m/s | numeric | 0.007 | Vertical velocity (positive downwards) |
| 14 | diffAge | s | numeric | - | Age of differential corrections (blank when DGPS is not used) |
| 15 | HDOP | - | numeric | 0.92 | HDOP, Horizontal Dilution of Precision |
| 16 | VDOP | - | numeric | 1.19 | VDOP, Vertical Dilution of Precision |
| 17 | TDOP | - | numeric | 0.77 | TDOP, Time Dilution of Precision |
| 18 | numSvs | - | numeric | 9 | Number of satellites used in the navigation solution |

POSITION continued

| Field No. | Name | Unit | Format | Example | Description |
|-----------|----------|------|-------------|---------|-------------------------------|
| 19 | reserved | - | numeric | 0 | Reserved, always set to 0 |
| 20 | DR | - | numeric | 0 | DR used |
| 21 | cs | - | hexadecimal | *5B | Checksum |
| 22 | <CR><LF> | - | character | - | Carriage return and line feed |

Table Navigation Status

| Navigation Status | Description |
|-------------------|--|
| NF | No Fix |
| DR | Dead reckoning only solution |
| G2 | Stand alone 2D solution |
| G3 | Stand alone 3D solution |
| D2 | Differential 2D solution |
| D3 | Differential 3D solution |
| RK | Combined GPS + dead reckoning solution |
| TT | Time only solution |

30.3.3 RATE (PUBX,40)

30.3.3.1 Set NMEA message output rate

| | | | |
|--------------|--|------------------|--|
| Message | RATE | | |
| Description | Set NMEA message output rate | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Set Message | | |
| Comment | Set/Get message rate configuration (s) to/from the receiver. • Send rate is relative to the event a message is registered on. For example, if the rate of a navigation message is set to 2, the message is sent every second navigation solution. | | |
| Message Info | ID for CFG-MSG | Number of fields | |
| | 0xF1 0x40 | 11 | |

Message Structure:

```
$PUBX,40,msgId,rddc,rus1,rus2,rusb,rspi,reserved*cs<CR><LF>
```

Example:

```
$PUBX,40,GLL,1,0,0,0,0,0,0*5D
```

| Field No. | Name | Unit | Format | Example | Description |
|-----------|--------|--------|---------|---------|---|
| 0 | \$PUBX | - | string | \$PUBX | Message ID, UBX protocol header, proprietary sentence |
| 1 | ID | - | numeric | 40 | Proprietary message identifier |
| 2 | msgId | - | string | GLL | NMEA message identifier |
| 3 | rddc | cycles | numeric | 1 | output rate on DDC 0 disables that message from being output on this port 1 means that this message is output every epoch |

RATE continued

| Field No. | Name | Unit | Format | Example | Description |
|-----------|----------|--------|-------------|---------|---|
| 4 | rus1 | cycles | numeric | 1 | output rate on USART 1 0 disables that message from being output on this port 1 means that this message is output every epoch |
| 5 | rus2 | cycles | numeric | 1 | output rate on USART 2 0 disables that message from being output on this port 1 means that this message is output every epoch |
| 6 | rusb | cycles | numeric | 1 | output rate on USB 0 disables that message from being output on this port 1 means that this message is output every epoch |
| 7 | rspi | cycles | numeric | 1 | output rate on SPI 0 disables that message from being output on this port 1 means that this message is output every epoch |
| 8 | reserved | - | numeric | 0 | Reserved: always fill with 0 |
| 9 | cs | - | hexadecimal | *5D | Checksum |
| 10 | <CR><LF> | - | character | - | Carriage return and line feed |

30.3.4 SVSTATUS (PUBX,03)

30.3.4.1 Satellite Status

| | | | |
|--------------|--|------------------|---------|
| Message | SVSTATUS | | |
| Description | Satellite Status | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Output Message | | |
| Comment | The PUBX,03 message contains satellite status information. | | |
| Message Info | ID for CFG-MSG | Number of fields | |
| | 0xF1 | 0x03 | 5 + 6*n |

Message Structure:

```
$PUBX,03,GT{,sv,s,az,e1,cno,lck},*cs<CR><LF>
```

Example:

```
$PUBX,03,11,23,-,,,45,010,29,-,,,46,013,07,-,,,42,015,08,U,067,31,42,025,10,U,195,33,46,026,18,U,32
6,08,39,026,17,-,,,32,015,26,U,306,66,48,025,27,U,073,10,36,026,28,U,089,61,46,024,15,-,,,39,014*0D
```

| Field No. | Name | Unit | Format | Example | Description |
|-----------------------------------|--------|------|---------|---------|---|
| 0 | \$PUBX | - | string | \$PUBX | Message ID, UBX protocol header, proprietary sentence |
| 1 | msgId | - | numeric | 03 | Proprietary message identifier: 03 |
| 2 | n | - | numeric | 11 | Number of GNSS satellites tracked |
| Start of repeated block (n times) | | | | | |

SVSTATUS continued

| Field No. | Name | Unit | Format | Example | Description |
|------------------------------|----------|-------|-------------|---------|---|
| 3 + 6*N | sv | - | numeric | 23 | Satellite ID according to UBX svId mapping (see section satellite numbering) |
| 4 + 6*N | s | - | character | - | Satellite status, see table below |
| 5 + 6*N | az | deg | numeric | - | Satellite azimuth (range: 0-359) |
| 6 + 6*N | el | deg | numeric | - | Satellite elevation (range: 0-90) |
| 7 + 6*N | cno | dBH z | numeric | 45 | Signal strength (C/N0, range 0-99), blank when not tracking |
| 8 + 6*N | lck | s | numeric | 010 | Satellite carrier lock time (range: 0-64) 0: code lock only 64: lock for 64 seconds or more |
| <i>End of repeated block</i> | | | | | |
| 3 + 6*n | cs | - | hexadecimal | *0D | Checksum |
| 4 + 6*n | <CR><LF> | - | character | - | Carriage return and line feed |

Table Satellite Status

| Satellite Status | Description |
|------------------|--|
| - | Not used |
| U | Used in solution |
| e | Ephemeris available, but not used for navigation |

30.3.5 TIME (PUBX,04)

30.3.5.1 Time of Day and Clock Information

| | | | |
|--------------|--|------------------|--|
| Message | TIME | | |
| Description | Time of Day and Clock Information | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | |
| Type | Output Message | | |
| Comment | - | | |
| Message Info | ID for CFG-MSG | Number of fields | |

```

Example:

```
$PUBX,04,073731.00,091202,113851.00,1196,15D,1930035,-2660.664,43,*3C
```

| Field No. | Name | Unit | Format | Example | Description |
|-----------|--------|------|--------|---------|---|
| 0 | \$PUBX | - | string | \$PUBX | Message ID, UBX protocol header, proprietary sentence |

TIME continued

| Field No. | Name | Unit | Format | Example | Description |
|-----------|----------|------|--------------|-----------|---|
| 1 | msgId | - | numeric | 04 | Proprietary message identifier: 04 |
| 2 | time | - | hhmmss.ss | 073731.00 | UTC time, see note on UTC representation |
| 3 | date | - | ddmmyy | 091202 | UTC date, day, month, year format, see note on UTC representation |
| 4 | utcTow | s | numeric | 113851.00 | UTC Time of Week |
| 5 | utcWk | - | numeric | 1196 | UTC week number, continues beyond 1023 |
| 6 | leapSec | s | numeric/text | 15D | Leap seconds The number is marked with a 'D' if the value is the firmware default value. If the value is not marked it has been received from a satellite. |
| 7 | clkBias | ns | numeric | 1930035 | Receiver clock bias |
| 8 | clkDrift | ns/s | numeric | -2660.664 | Receiver clock drift |
| 9 | tpGran | ns | numeric | 43 | Time Pulse Granularity, The quantization error of the TIMEPULSE pin |
| 10 | cs | - | hexadecimal | *3C | Checksum |
| 11 | <CR><LF> | - | character | - | Carriage Return and Line Feed |

31 UBX Protocol

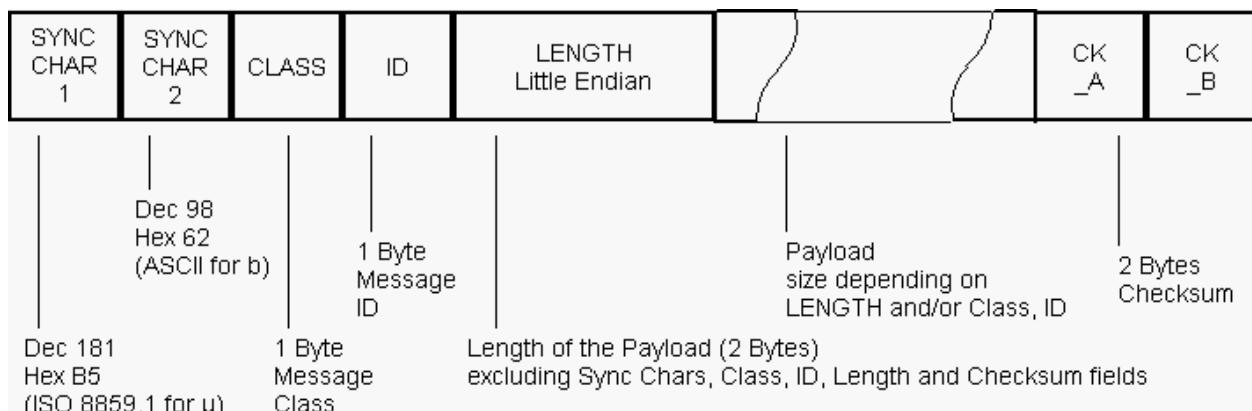

31.1 UBX Protocol Key Features

u-blox receivers support a u-blox proprietary protocol to communicate with a host computer. This protocol has the following key features:

- Compact - uses 8 Bit Binary Data.
- Checksum Protected - uses a low-overhead checksum algorithm
- Modular - uses a 2-stage message identifier (Class and Message ID)

31.2 UBX Packet Structure

A basic UBX Packet looks as follows:

- Every Message starts with 2 Bytes: 0xB5 0x62
- A 1 Byte Class Field follows. The Class defines the basic subset of the message
- A 1 Byte ID Field defines the message that is to follow

- A 2 Byte Length Field is following. Length is defined as being the length of the payload, only. It does not include Sync Chars, Length Field, Class, ID or CRC fields. The number format of the length field is an unsigned 16-Bit integer in Little Endian Format.
- The Payload is a variable length field.
- CK_A and CK_B is a 16 Bit checksum whose calculation is defined below.

31.3 UBX Payload Definition Rules

31.3.1 Structure Packing

Values are placed in an order that structure packing is not a problem. This means that 2 byte values shall start on offsets which are a multiple of 2, 4 byte values shall start at a multiple of 4, and so on.

31.3.2 Reserved Elements

Some messages contain reserved fields or bits to allow for future expansion. The contents of these elements should be ignored in output messages and must be set to zero in input messages. Where a message is output and subsequently returned to the receiver as input message, reserved elements can either be explicitly set to zero or left with whatever value they were output with.

31.3.3 Undefined Values

The description of some fields provide specific meanings for specific values. For example, the field gnssId appears in many UBX messages and uses 0 to indicate GPS, 1 for SBAS and so on (see [Satellite Numbering](#) for details); however it is usually stored in a byte with far more possible values than the handful currently defined. All such undefined values are reserved for future expansion and therefore should not be used.

31.3.4 Message Naming

Referring to messages is done by adding the class name and a dash in front of the message name. For example, the ECEF-Message is referred to as UBX-NAV-POSECEF. Referring to values is done by adding a dash and the name, e.g. UBX-NAV-POSECEF-X

31.3.5 Number Formats

All multi-byte values are ordered in Little Endian format, unless otherwise indicated.

All floating point values are transmitted in IEEE754 single or double precision.

Variable Type Definitions

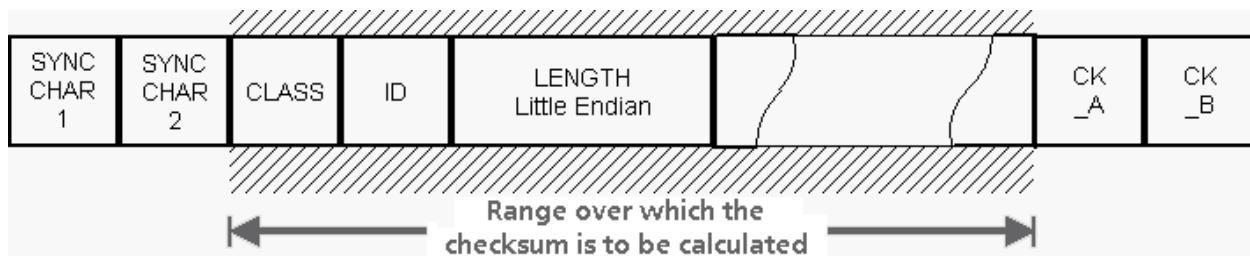

| Short | Type | Size (Bytes) | Comment | Min/Max | Resolution |
|-------|----------------|-----------------|--|-------------------------------|------------------|
| U1 | Unsigned Char | 1 | | 0..255 | 1 |
| RU1_3 | Unsigned Char | 1 | binary floating point with 3 bit exponent, eeeb bbbb, (Value & 0x1F) << (Value >> 5) | 0..(31*2^7) non-continuous | ~ 2^(Value >> 5) |
| I1 | Signed Char | 1 | 2's complement | -128..127 | 1 |
| X1 | Bitfield | 1 | | n/a | n/a |
| U2 | Unsigned Short | 2 | | 0..65535 | 1 |
| I2 | Signed Short | 2 | 2's complement | -32768..32767 | 1 |

Variable Type Definitions continued

| Short | Type | Size (Bytes) | Comment | Min/Max | Resolution |
|-------|-----------------------------|-----------------|----------------|------------------------------------|-----------------|
| X2 | Bitfield | 2 | | n/a | n/a |
| U4 | Unsigned Long | 4 | | 0..4'294'967'295 | 1 |
| I4 | Signed Long | 4 | 2's complement | -2'147'483'648 .. 2'147'483'647 | 1 |
| X4 | Bitfield | 4 | | n/a | n/a |
| R4 | IEEE 754 Single Precision | 4 | | -1*2^+127 .. 2^-127 | ~ Value * 2^-24 |
| R8 | IEEE 754 Double Precision | 8 | | -1*2^+1023 .. 2^-1023 | ~ Value * 2^-53 |
| CH | ASCII / ISO 8859.1 Encoding | 1 | | | |

31.4 UBX Checksum

The checksum is calculated over the packet, starting and including the CLASS field, up until, but excluding, the Checksum Field:

The checksum algorithm used is the 8-Bit Fletcher Algorithm, which is used in the TCP standard ([RFC 1145](#)). This algorithm works as follows:

Buffer[N] contains the data over which the checksum is to be calculated.

The two CK_ values are 8-Bit unsigned integers, only! If implementing with larger-sized integer values, make sure to mask both CK_A and CK_B with 0xFF after both operations in the loop.

```

CK_A = 0, CK_B = 0
For (I=0; I<N; I++)
{
    CK_A = CK_A + Buffer[I]
    CK_B = CK_B + CK_A
}

```

After the loop, the two U1 values contain the checksum, transmitted at the end of the packet.

31.5 UBX Message Flow

There are certain features associated with the messages being sent back and forth:

31.5.1 Acknowledgement

When messages from the class CFG are sent to the receiver, the receiver will send an "acknowledge" ([ACK-ACK](#)) or a "not acknowledge" ([ACK-NAK](#)) message back to the sender, depending on whether or not the message was processed correctly.

Some messages from other classes (e.g. LOG) also use the same acknowledgement mechanism.

31.5.2 Polling Mechanism

All messages that are output by the receiver in a periodic manner (i.e. messages in classes MON, NAV and RXM) can also be polled.

The UBX protocol is designed so that messages can be polled by sending the message required to the receiver but without a payload (or with just a single parameter that identifies the poll request). The receiver then responds with the same message with the payload populated.

31.6 UBX Satellite Numbering

UBX protocol messages use two different numbering schemes. Many UBX messages (e.g. [UBX-NAV-SVINFO](#)) use a single byte for the satellite identifier (normally named "svid"). This uses numbering similar to the "extended" NMEA scheme and is merely an extension of the scheme in use for previous generations of u-blox receivers.

With ever increasing numbers of GNSS satellites, this scheme will have to be phased out in future u-blox receivers (as numbers greater than 255 will become necessary). Consequently, newer messages use a more sophisticated, flexible and future-proof approach. This involves having a separate *gnssId* to identify which GNSS the satellite is part of and a simple *svId* which indicates which number the satellite is in that system. In nearly all cases, this means that the "svId" is the natural number associated with the satellite. For example the GLONASS SV4 is identified as *gnssId* 6, *svId* 4, while the GPS SV4 is *gnssId* 0, *svId* 4.

See [Satellite Numbering Summary](#) for a complete list of satellite numbers.

GNSS Identifiers

| <i>gnssId</i> | GNSS |
|---------------|---------|
| 0 | GPS |
| 1 | SBAS |
| 2 | Galileo |
| 3 | BeiDou |
| 4 | IMES |
| 5 | QZSS |
| 6 | GLONASS |

Other values will be added as support for other GNSS types is enabled in u-blox receivers.

u-blox designates GPS, Galileo, BeiDou and GLONASS as major GNSS, and the others as augmentation systems. These designations are described in the section on [GNSS Types](#).

GLOASS satellites can be tracked before they have been identified. In UBX messages, such unknown satellite numbers are always reported with svid 255.

31.7 UBX Class IDs

A class is a grouping of messages which are related to each other. The following table lists all the current message classes.

| Name | Class | Description |
|------|-------|--|
| NAV | 0x01 | Navigation Results Messages: Position, Speed, Time, Acceleration, Heading, DOP, SVs used |
| RXM | 0x02 | Receiver Manager Messages: Satellite Status, RTC Status |
| INF | 0x04 | Information Messages: Printf-Style Messages, with IDs such as Error, Warning, Notice |
| ACK | 0x05 | Ack/Nak Messages: Acknowledge or Reject messages to CFG input messages |
| CFG | 0x06 | Configuration Input Messages: Set Dynamic Model, Set DOP Mask, Set Baud Rate, etc. |

UBX Class IDs continued

| Name | Class | Description |
|------|-------|--|
| UPD | 0x09 | Firmware Update Messages: Memory/Flash erase/write, Reboot, Flash identification, etc. |
| MON | 0x0A | Monitoring Messages: Communication Status, CPU Load, Stack Usage, Task Status |
| AID | 0x0B | AssistNow Aiding Messages: Ephemeris, Almanac, other A-GPS data input |
| TIM | 0x0D | Timing Messages: Time Pulse Output, Time Mark Results |
| ESF | 0x10 | External Sensor Fusion Messages: External Sensor Measurements and Status Information |
| MGA | 0x13 | Multiple GNSS Assistance Messages: Assistance data for various GNSS |
| LOG | 0x21 | Logging Messages: Log creation, deletion, info and retrieval |
| SEC | 0x27 | Security Feature Messages |
| HNR | 0x28 | High Rate Navigation Results Messages: High rate time, position, speed, heading |

All remaining class IDs are reserved.

31.8 UBX Messages Overview

| Page | Mnemonic | Cls/IID | Length | Type | Description |
|----------------------|----------------------|-----------|-----------------|-------------------------------------|--|
| UBX Class ACK | | | | Ack/Nak Messages | |
| 142 | ACK-ACK | 0x05 0x01 | 2 | Output | Message Acknowledged |

31.9 UBX-ACK (0x05)

Ack/Nak Messages: i.e. Acknowledge or Reject messages to CFG input messages.

Messages in the ACK class output the processing results to CFG and some other messages (like [UBX-LOG-CREATE](#)).

31.9.1 UBX-ACK-ACK (0x05 0x01)

31.9.1.1 Message Acknowledged

| | | | | | | |
|--------------------------|--|----------------|-------------|-----------------------|--|----------------------------|
| <i>Message</i> | ACK-ACK | | | | | |
| <i>Description</i> | Message Acknowledged | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| <i>Type</i> | Output | | | | | |
| <i>Comment</i> | Output upon processing of an input message | | | | | |

31.10 UBX-AID (0x0B)

AssistNow Aiding Messages: i.e. Ephemeris, Almanac, other A-GPS data input.
Messages in the AID class are used to send GPS aiding data to the receiver.

31.10.1 UBX-AID-ALM (0x0B 0x30)

31.10.1.1 Poll GPS Aiding Almanac Data

| | | | | | | |
|--------------------------|---|--------------|-----------|-----------------------|------------------|-----------------|
| <i>Message</i> | AID-ALM | | | | | |
| <i>Description</i> | Poll GPS Aiding Almanac Data | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| <i>Type</i> | Poll Request | | | | | |
| <i>Comment</i> | All UBX-AID messages are deprecated; use UBX-MGA messages instead Poll GPS Aiding Data (Almanac) for all 32 SVs by sending this message to the receiver without any payload. The receiver will return 32 messages of type AID-ALM as defined below. | | | | | |
| | <i>Header</i> | <i>Class</i> | <i>ID</i> | <i>Length (Bytes)</i> | <i>Payload</i> | <i>Checksum</i> |
| <i>Message Structure</i> | 0xB5 0x62 | 0x0B | 0x30 | 0 | <i>see below</i> | CK_A CK_B |
| <i>No payload</i> | | | | | | |

31.10.1.2 Poll GPS Aiding Almanac Data for a SV

| | | | | | | |
|--------------------------|--|----------------|-------------|-----------------------|--|-----------------|
| <i>Message</i> | AID-ALM | | | | | |
| <i>Description</i> | Poll GPS Aiding Almanac Data for a SV | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| <i>Type</i> | Poll Request | | | | | |
| <i>Comment</i> | All UBX-AID messages are deprecated; use UBX-MGA messages instead Poll GPS Aiding Data (Almanac) for an SV by sending this message to the receiver. The receiver will return one message of type AID-ALM as defined below. | | | | | |
| | <i>Header</i> | <i>Class</i> | <i>ID</i> | <i>Length (Bytes)</i> | <i>Payload</i> | <i>Checksum</i> |
| <i>Message Structure</i> | 0xB5 0x62 | 0x0B | 0x30 | 1 | <i>see below</i> | CK_A CK_B |
| <i>Payload Contents:</i> | | | | | | |
| <i>Byte Offset</i> | <i>Number Format</i> | <i>Scaling</i> | <i>Name</i> | <i>Unit</i> | <i>Description</i> | |
| 0 | U1 | - | svid | - | SV ID for which the receiver shall return its Almanac Data (Valid Range: 1 .. 32 or 51, 56, 63). | |

31.10.1.3 GPS Aiding Almanac Input/Output Message

| | | | | | | |
|-------------------------|---|---------|------|----------------|--|-----------|
| Message | AID-ALM | | | | | |
| Description | GPS Aiding Almanac Input/Output Message | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Input/Output | | | | | |
| Comment | All UBX-AID messages are deprecated; use UBX-MGA messages instead <ul style="list-style-type: none"> If the WEEK Value is 0, DWRD0 to DWRD7 are not sent as the Almanac is not available for the given SV. This may happen even if NAV-SVINFO and RXM-SVSI are indicating almanac availability as the internal data may not represent the content of an original broadcast almanac (or only parts thereof). DWORD0 to DWORD7 contain the 8 words following the Hand-Over Word (HOW) from the GPS navigation message, either pages 1 to 24 of sub-frame 5 or pages 2 to 10 of subframe 4. See IS-GPS-200 for a full description of the contents of the Almanac pages. In DWORD0 to DWORD7, the parity bits have been removed, and the 24 bits of data are located in Bits 0 to 23. Bits 24 to 31 shall be ignored. Example: Parameter e (Eccentricity) from Almanac Subframe 4/5, Word 3, Bits 69-84 within the subframe can be found in DWRD0, Bits 15-0 whereas Bit 0 is the LSB. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 0x62 | 0x0B | 0x30 | (8) or (40) | see below | CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U4 | - | svid | - | SV ID for which this Almanac Data is (Valid Range: 1 .. 32 or 51, 56, 63). | |
| 4 | U4 | - | week | - | Issue Date of Almanac (GPS week number) | |
| Start of optional block | | | | | | |
| 8 | U4[8] | - | dwrd | - | Almanac Words | |
| End of optional block | | | | | | |

31.10.2 UBX-AID-AOP (0x0B 0x33)

31.10.2.1 Poll AssistNow Autonomous data, all satellites

| | | | | | | |
|-------------------|--|-------|------|----------------|-----------|-----------|
| Message | AID-AOP | | | | | |
| Description | Poll AssistNow Autonomous data, all satellites | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Poll Request | | | | | |
| Comment | All UBX-AID messages are deprecated; use UBX-MGA messages instead Poll AssistNow Autonomous aiding data for all GPS satellites by sending this empty message. The receiver will return an AID-AOP message (see definition below) for each GPS satellite for which data is available. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 0x62 | 0x0B | 0x33 | 0 | see below | CK_A CK_B |

No payload

31.10.2.2 Poll AssistNow Autonomous data, one GPS satellite

| | | | | | | |
|-------------------|---|---------|------|----------------|---|---------------------|
| Message | AID-AOP | | | | | |
| Description | Poll AssistNow Autonomous data, one GPS satellite | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Poll Request | | | | | |
| Comment | All UBX-AID messages are deprecated; use UBX-MGA messages instead Poll the AssistNow Autonomous data for the specified GPS satellite. The receiver will return a AID-AOP message (see definition below) if data is available for the requested satellite. | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 | 0x62 | 0x0B | 0x33 | 1 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | svid | - | GPS SV ID for which the data is requested (valid range: 1..32). | |

31.10.2.3 AssistNow Autonomous data

| | | | | | | |
|-------------------|--|---------|-----------|----------------|---|---------------------|
| Message | AID-AOP | | | | | |
| Description | AssistNow Autonomous data | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Input/Output | | | | | |
| Comment | All UBX-AID messages are deprecated; use UBX-MGA messages instead If enabled, this message is output at irregular intervals. It is output whenever AssistNow Autonomous has produced new data for a satellite. Depending on the availability of the optional data the receiver will output either version of the message. If this message is polled using one of the two poll requests described above the receiver will send this message if AssistNow Autonomous data is available or the corresponding poll request message if no AssistNow Autonomous data is available for each satellite (i.e. svId 1..32). At the user's choice the optional data may be chopped from the payload of a previously polled message when sending the message back to the receiver. Sending a valid AID-AOP message to the receiver will automatically enable the AssistNow Autonomous feature on the receiver. See the section AssistNow Autonomous in the receiver description for details on this feature. | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 | 0x62 | 0x0B | 0x33 | 68 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | gnssId | - | GNSS identifier (see Satellite Numbering) | |
| 1 | U1 | - | svId | - | Satellite identifier (see Satellite Numbering) | |
| 2 | U1[2] | - | reserved1 | - | Reserved | |

| 4 | U1[64] | - | data | - | assistance data |

31.10.3 UBX-AID-EPH (0x0B 0x31)

31.10.3.1 Poll GPS Aiding Ephemeris Data

| | | | | | |
|--------------------------|---|--------------|-----------|-----------------------|------------------|
| <i>Message</i> | AID-EPH | | | | |
| <i>Description</i> | Poll GPS Aiding Ephemeris Data | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | |
| <i>Type</i> | Poll Request | | | | |
| <i>Comment</i> | All UBX-AID messages are deprecated; use UBX-MGA messages instead Poll GPS Aiding Data (Ephemeris) for all 32 SVs by sending this message to the receiver without any payload. The receiver will return 32 messages of type AID-EPH as defined below. | | | | |
| <i>Message Structure</i> | <i>Header</i> | <i>Class</i> | <i>ID</i> | <i>Length (Bytes)</i> | <i>Payload</i> |
| | 0xB5 0x62 | 0x0B | 0x31 | 0 | <i>see below</i> |
| <i>No payload</i> | | | | | |

31.10.3.2 Poll GPS Aiding Ephemeris Data for a SV

| | | | | | | |
|-------------------|--|---------|------|----------------|--|----------------------------|
| Message | AID-EPH | | | | | |
| Description | Poll GPS Aiding Ephemeris Data for a SV | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Poll Request | | | | | |
| Comment | All UBX-AID messages are deprecated; use UBX-MGA messages instead Poll GPS Constellation Data (Ephemeris) for an SV by sending this message to the receiver. The receiver will return one message of type AID-EPH as defined below. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x0B | 0x31 | 1 | <i>see below</i> CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | svid | - | SV ID for which the receiver shall return its Ephemeris Data (Valid Range: 1 .. 32). | |

31.10.3.3 GPS Aiding Ephemeris Input/Output Message

| | | | | | | |
|-------------------|--|---------|------|----------------|--|----------------------------|
| Message | AID-EPH | | | | | |
| Description | GPS Aiding Ephemeris Input/Output Message | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Input/Output | | | | | |
| Comment | All UBX-AID messages are deprecated; use UBX-MGA messages instead • SF1D0 to SF3D7 is only sent if ephemeris is available for this SV. If not, the payload may be reduced to 8 Bytes, or all bytes are set to zero, indicating that this SV Number does not have valid ephemeris for the moment. This may happen even if NAV-SVINFO and RXM-SVSI are indicating ephemeris availability as the internal data may not represent the content of an original broadcast ephemeris (or only parts thereof). • SF1D0 to SF3D7 contain the 24 words following the Hand-Over Word (HOW) from the GPS navigation message, subframes 1 to 3. The Truncated TOW Count is not valid and cannot be used. See IS-GPS-200 for a full description of the contents of the Subframes. • In SF1D0 to SF3D7, the parity bits have been removed, and the 24 bits of data are located in Bits 0 to 23. Bits 24 to 31 shall be ignored. • When polled, the data contained in this message does not represent the full original ephemeris broadcast. Some fields that are irrelevant to u-blox receivers may be missing. The week number in Subframe 1 has already been modified to match the Time Of Ephemeris (TOE). | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x0B | 0x31 | (8) or (104) | <i>see below</i> CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U4 | - | svid | - | SV ID for which this ephemeris data is (Valid Range: 1 .. 32). | |

AID-EPH continued

| Byte Offset | Number Format | Scaling | Name | Unit | Description |
|--------------------------------|---------------|---------|------|------|---|
| 4 | U4 | - | how | - | Hand-Over Word of first Subframe. This is required if data is sent to the receiver. 0 indicates that no Ephemeris Data is following. |
| <i>Start of optional block</i> | | | | | |
| 8 | U4[8] | - | sf1d | - | Subframe 1 Words 3..10 (SF1D0..SF1D7) |
| 40 | U4[8] | - | sf2d | - | Subframe 2 Words 3..10 (SF2D0..SF2D7) |
| 72 | U4[8] | - | sf3d | - | Subframe 3 Words 3..10 (SF3D0..SF3D7) |
| <i>End of optional block</i> | | | | | |

31.10.4 UBX-AID-HUI (0x0B 0x02)

31.10.4.1 Poll GPS Health, UTC, ionosphere parameters

| | | | | | | |
|-------------------|--|-------|------|----------------|---------|---------------------|
| Message | AID-HUI | | | | | |
| Description | Poll GPS Health, UTC, ionosphere parameters | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Poll Request | | | | | |
| Comment | All UBX-AID messages are deprecated; use UBX-MGA messages instead - | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 | 0x62 | 0x0B | 0x02 | 0 | see below CK_A CK_B |
| No payload | | | | | | |

31.10.4.2 GPS Health, UTC and ionosphere parameters

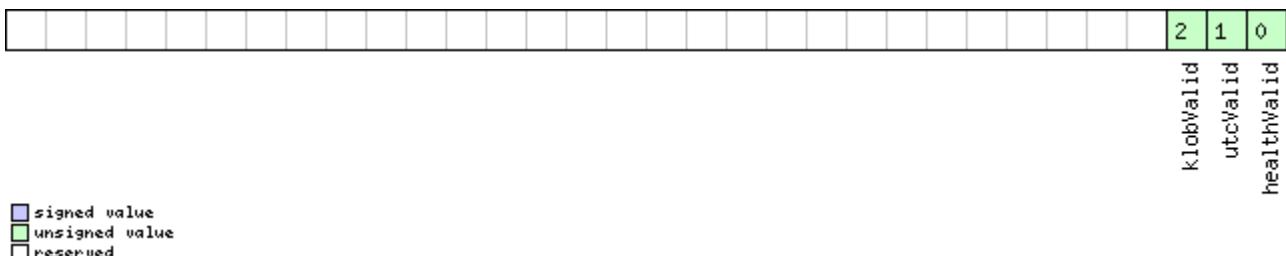

| Message | AID-HUI | | | | | |
|-------------------|--|---------|--------|----------------|---|---------------------|
| Description | GPS Health, UTC and ionosphere parameters | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Input/Output | | | | | |
| Comment | All UBX-AID messages are deprecated; use UBX-MGA messages instead This message contains a health bit mask, UTC time and Klobuchar parameters. For more information on these parameters, see the ICD-GPS-200 documentation. | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 | 0x62 | 0x0B | 0x02 | 72 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | X4 | - | health | - | Bitmask, every bit represents a GPS SV (1-32). If the bit is set the SV is healthy. | |
| 4 | R8 | - | utcA0 | - | UTC - parameter A0 | |
| 12 | R8 | - | utcA1 | - | UTC - parameter A1 | |
| 20 | I4 | - | utcTOW | - | UTC - reference time of week | |
| 24 | I2 | - | utcWNT | - | UTC - reference week number | |

AID-HUI continued

| Byte Offset | Number Format | Scaling | Name | Unit | Description |
|-------------|---------------|---------|----------|----------------|--|
| 26 | I2 | - | utcLS | - | UTC - time difference due to leap seconds before event |
| 28 | I2 | - | utcWNF | - | UTC - week number when next leap second event occurs |
| 30 | I2 | - | utcDN | - | UTC - day of week when next leap second event occurs |
| 32 | I2 | - | utcLSF | - | UTC - time difference due to leap seconds after event |
| 34 | I2 | - | utcSpare | - | UTC - Spare to ensure structure is a multiple of 4 bytes |
| 36 | R4 | - | klobA0 | s | Klobuchar - alpha 0 |
| 40 | R4 | - | klobA1 | s/semicircle | Klobuchar - alpha 1 |
| 44 | R4 | - | klobA2 | s/semicircle^2 | Klobuchar - alpha 2 |
| 48 | R4 | - | klobA3 | s/semicircle^3 | Klobuchar - alpha 3 |
| 52 | R4 | - | klobB0 | s | Klobuchar - beta 0 |
| 56 | R4 | - | klobB1 | s/semicircle | Klobuchar - beta 1 |
| 60 | R4 | - | klobB2 | s/semicircle^2 | Klobuchar - beta 2 |
| 64 | R4 | - | klobB3 | s/semicircle^3 | Klobuchar - beta 3 |
| 68 | X4 | - | flags | - | flags (see graphic below) |

Bitfield flags

This graphic explains the bits of flags

| Name | Description |
|-------------|--|
| healthValid | Healthmask field in this message is valid |
| utcValid | UTC parameter fields in this message are valid |
| klobValid | Klobuchar parameter fields in this message are valid |

31.10.5 UBX-AID-INI (0x0B 0x01)

31.10.5.1 Poll GPS Initial Aiding Data

| | | | | | | |
|-------------------|--|-------|------|----------------|---------|---------------------|
| Message | AID-INI | | | | | |
| Description | Poll GPS Initial Aiding Data | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Poll Request | | | | | |
| Comment | All UBX-AID messages are deprecated; use UBX-MGA messages instead - | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x0B | 0x01 | 0 | see below CK_A CK_B |
| No payload | | | | | | |

31.10.5.2 Aiding position, time, frequency, clock drift

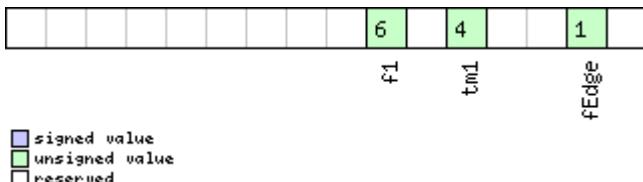

| | | | | | | |
|-------------------|--|---------|------------|---------------------|--|---------------------|
| Message | AID-INI | | | | | |
| Description | Aiding position, time, frequency, clock drift | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Input/Output | | | | | |
| Comment | All UBX-AID messages are deprecated; use UBX-MGA messages instead This message contains position, time and clock drift information. The position can be input in either the ECEF X/Y/Z coordinate system or as lat/lon/height. The time can either be input as inexact value via the standard communication interface, suffering from latency depending on the baud rate, or using hardware time synchronization where an accurate time pulse is input on the external interrupts. It is also possible to supply hardware frequency aiding by connecting a continuous signal to an external interrupt. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x0B | 0x01 | 48 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | I4 | - | ecefXOrLat | cm_or_ deg*1e -7 | WGS84 ECEF X coordinate or latitude, depending on flags below | |
| 4 | I4 | - | ecefYOrLon | cm_or_ deg*1e -7 | WGS84 ECEF Y coordinate or longitude, depending on flags below | |
| 8 | I4 | - | ecefZOrAlt | cm | WGS84 ECEF Z coordinate or altitude, depending on flags below | |
| 12 | U4 | - | posAcc | cm | Position accuracy (stddev) | |
| 16 | X2 | - | tmCfg | - | Time mark configuration (see graphic below) | |
| 18 | U2 | - | wnoOrDate | week_o r_year Month | Actual week number or yearSince2000/Month (YYMM), depending on flags below | |

AID-INI continued

| Byte Offset | Number Format | Scaling | Name | Unit | Description |
|-------------|---------------|---------|------------------|------------------------|---|
| 20 | U4 | - | towOrTime | ms_or_dayHourMinuteSec | Actual time of week or DayOfMonth/Hour/Minute/Second (DDHHMMSS), depending on flags below |
| 24 | I4 | - | towNs | ns | Fractional part of time of week |
| 28 | U4 | - | tAccMs | ms | Milliseconds part of time accuracy |
| 32 | U4 | - | tAccNs | ns | Nanoseconds part of time accuracy |
| 36 | I4 | - | clkDOrFreqAcc | ns/s_or_Hz*1e-2 | Clock drift or frequency, depending on flags below |
| 40 | U4 | - | clkDAccOrFreqAcc | ns/s_or_ppb | Accuracy of clock drift or frequency, depending on flags below |
| 44 | X4 | - | flags | - | Bitmask with the following flags (see graphic below) |

Bitfield tmCfg

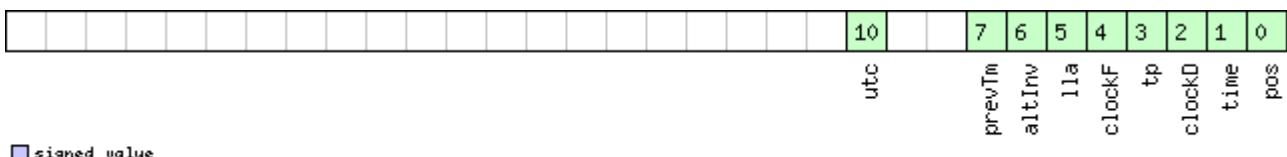

This graphic explains the bits of tmCfg

| Name | Description |
|-------|--|
| fEdge | use falling edge (default rising) |
| tm1 | time mark on extint 1 (default extint 0) |
| f1 | frequency on extint 1 (default extint 0) |

Bitfield flags

This graphic explains the bits of flags

| Name | Description |
|--------|---|
| pos | Position is valid |
| time | Time is valid |
| clockD | Clock drift data contains valid clock drift, must not be set together with clockF |
| tp | Use time pulse |
| clockF | Clock drift data contains valid frequency, must not be set together with clockD |
| lla | Position is given in lat/long/alt (default is ECEF) |
| altInv | Altitude is not valid, if lla was set |

Bitfield flags Description continued

| Name | Description |
|--------|--|
| prevTm | Use time mark received before AID-INI message (default uses mark received after message) |
| utc | Time is given as UTC date/time (default is GPS wno/tow) |

31.11 UBX-CFG (0x06)

Configuration Input Messages: i.e. Set Dynamic Model, Set DOP Mask, Set Baud Rate, etc..

Messages in the CFG class are used to configure the receiver and read out current configuration values. Any messages in the CFG class sent to the receiver are either acknowledged (with message [UBX-ACK-ACK](#)) if processed successfully or rejected (with message [UBX-ACK-NAK](#)) if processing unsuccessfully.

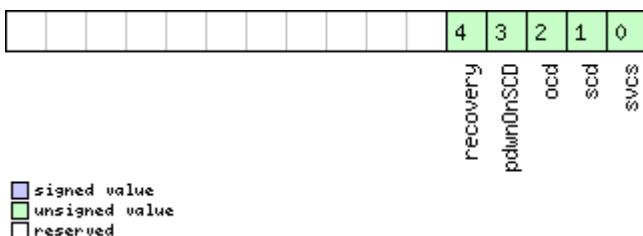

31.11.1 UBX-CFG-ANT (0x06 0x13)

31.11.1.1 Antenna Control Settings

| | | | | | | |
|-------------------|--|---------|-------|----------------|--|---------------------|
| Message | CFG-ANT | | | | | |
| Description | Antenna Control Settings | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Get/Set | | | | | |
| Comment | - | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x06 | 0x13 | 4 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | X2 | - | flags | - | Antenna Flag Mask (see graphic below) | |
| 2 | X2 | - | pins | - | Antenna Pin Configuration (see graphic below) | |

Bitfield flags

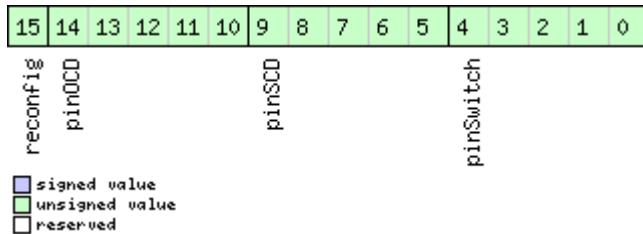

This graphic explains the bits of flags

| | |
|-----------|--|
| Name | Description |
| svcs | Enable Antenna Supply Voltage Control Signal |
| scd | Enable Short Circuit Detection |
| ocd | Enable Open Circuit Detection |
| pdwnOnSCD | Power Down Antenna supply if Short Circuit is detected. (only in combination with Bit 1) |
| recovery | Enable automatic recovery from short state |

Bitfield pins

This graphic explains the bits of pins

| Name | Description |
|-----------|---|
| pinSwitch | PIO-Pin used for switching antenna supply |
| pinSCD | PIO-Pin used for detecting a short in the antenna supply |
| pinOCD | PIO-Pin used for detecting open/not connected antenna |
| reconfig | if set to one, and this command is sent to the receiver, the receiver will reconfigure the pins as specified. |

31.11.2 UBX-CFG-CFG (0x06 0x09)

31.11.2.1 Clear, Save and Load configurations

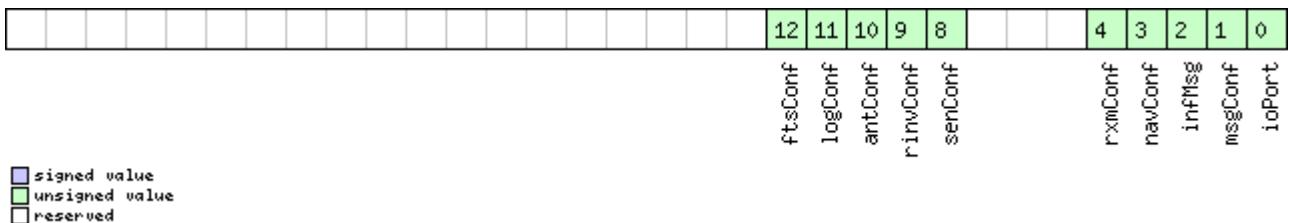

| | | | | | | |
|-------------------------|--|---------|------------|-------------------|--|-----------|
| Message | CFG-CFG | | | | | |
| Description | Clear, Save and Load configurations | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Command | | | | | |
| Comment | See Receiver Configuration for a detailed description on how Receiver Configuration should be used. The three masks are made up of individual bits, each bit indicating the sub-section of all configurations on which the corresponding action shall be carried out. The reserved bits in the masks must be set to '0'. For detailed information refer to the Organization of the Configuration Sections . Note that commands can be combined. The sequence of execution is Clear, Save, Load | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x06 | 0x09 (12) or (13) | see below | CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | X4 | - | clearMask | - | Mask with configuration sub-sections to clear (i.e. load default configurations to permanent configurations in non-volatile memory) (see graphic below) | |
| 4 | X4 | - | saveMask | - | Mask with configuration sub-sections to save (i.e. save current configurations to non-volatile memory), see ID description of clearMask | |
| 8 | X4 | - | loadMask | - | Mask with configuration sub-sections to load (i.e. load permanent configurations from non-volatile memory to current configurations), see ID description of clearMask | |
| Start of optional block | | | | | | |
| 12 | X1 | - | deviceMask | - | Mask which selects the memory devices for this command. (see graphic below) | |

CFG-CFG continued

| Byte Offset | Number Format | Scaling | Name | Unit | Description |
|------------------------------|---------------|---------|------|------|-------------|
| <i>End of optional block</i> | | | | | |

Bitfield clearMask

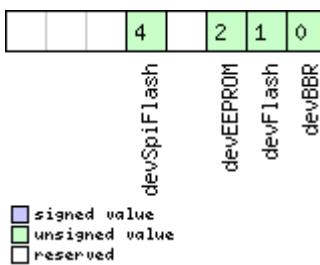

This graphic explains the bits of `clearMask`

| Name | Description |
|----------|--|
| ioPort | Communications port settings. Modifying this sub-section results in an IO system reset. Because of this undefined data may be output for a short period of time after receiving the message. |
| msgConf | Message configuration |
| infMsg | INF message configuration |
| navConf | Navigation configuration |
| rxmConf | Receiver Manager configuration |
| senConf | Sensor interface configuration (not supported in protocol versions less than 19) |
| rinvConf | Remote inventory configuration |
| antConf | Antenna configuration |
| logConf | Logging configuration |
| ftsConf | FTS configuration. Only applicable to the FTS product variant. |

Bitfield deviceMask

This graphic explains the bits of `deviceMask`

| Name | Description |
|-------------|--------------------|
| devBBR | Battery backed RAM |
| devFlash | Flash |
| devEEPROM | EEPROM |
| devSpiFlash | SPI Flash |

31.11.3 UBX-CFG-DAT (0x06 0x06)

31.11.3.1 Set User-defined Datum.

| Message | CFG-DAT | | | | | |
|-------------------|---|---------|-------|----------------|---|-----------|
| Description | Set User-defined Datum. | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Set | | | | | |
| Comment | For more information see the description of Geodetic Systems and Frames . | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 | 0x62 | 0x06 | 44 | see below | CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | R8 | - | majA | m | Semi-major Axis (accepted range = 6,300,000.0 to 6,500,000.0 meters). | |
| 8 | R8 | - | fflat | - | 1.0 / Flattening (accepted range is 0.0 to 500.0). | |
| 16 | R4 | - | dx | m | X Axis shift at the origin (accepted range is +/- 5000.0 meters). | |
| 20 | R4 | - | dy | m | Y Axis shift at the origin (accepted range is +/- 5000.0 meters). | |
| 24 | R4 | - | dz | m | Z Axis shift at the origin (accepted range is +/- 5000.0 meters). | |
| 28 | R4 | - | rotX | s | Rotation about the X Axis (accepted range is +/- 20.0 milli-arc seconds). | |
| 32 | R4 | - | rotY | s | Rotation about the Y Axis (accepted range is +/- 20.0 milli-arc seconds). | |
| 36 | R4 | - | rotZ | s | Rotation about the Z Axis (accepted range is +/- 20.0 milli-arc seconds). | |
| 40 | R4 | - | scale | ppm | Scale change (accepted range is 0.0 to 50.0 parts per million). | |

31.11.3.2 The currently defined Datum

| Message | CFG-DAT | | | | | |
|-------------------|---|---------|------|----------------|-------------|-----------|
| Description | The currently defined Datum | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Get | | | | | |
| Comment | Returns the parameters of the currently defined datum. If no user-defined datum has been set, this will default to WGS84. | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 | 0x62 | 0x06 | 52 | see below | CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |

CFG-DAT continued

| Byte Offset | Number Format | Scaling | Name | Unit | Description |
|-------------|---------------|---------|-----------|------|---|
| 0 | U2 | - | datumNum | - | Datum Number: 0 = WGS84, 0xFFFF = user-defined |
| 2 | CH[6] | - | datumName | - | ASCII String: WGS84 or USER |
| 8 | R8 | - | majA | m | Semi-major Axis (accepted range = 6,300,000.0 to 6,500,000.0 meters). |
| 16 | R8 | - | flat | - | 1.0 / Flattening (accepted range is 0.0 to 500.0). |
| 24 | R4 | - | dx | m | X Axis shift at the origin (accepted range is +/- 5000.0 meters). |
| 28 | R4 | - | dy | m | Y Axis shift at the origin (accepted range is +/- 5000.0 meters). |
| 32 | R4 | - | dz | m | Z Axis shift at the origin (accepted range is +/- 5000.0 meters). |
| 36 | R4 | - | rotX | s | Rotation about the X Axis (accepted range is +/- 20.0 milli-arc seconds). |
| 40 | R4 | - | rotY | s | Rotation about the Y Axis (accepted range is +/- 20.0 milli-arc seconds). |
| 44 | R4 | - | rotZ | s | Rotation about the Z Axis (accepted range is +/- 20.0 milli-arc seconds). |
| 48 | R4 | - | scale | ppm | Scale change (accepted range is 0.0 to 50.0 parts per million). |

31.11.4 UBX-CFG-DGNSS (0x06 0x70)

31.11.4.1 DGNSS configuration

| | | | | | | |
|-------------------|---|-------|------|----------------|---------|---------------------|
| Message | CFG-DGNSS | | | | | |
| Description | DGNSS configuration | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 20.01 up to version 23.01 (only with High Precision GNSS products) | | | | | |
| Type | Get/Set | | | | | |
| Comment | This message allows the user to configure the DGNSS configuration of the receiver. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x06 | 0x70 | 4 | see below CK_A CK_B |

Payload Contents:

| Byte Offset | Number Format | Scaling | Name | Unit | Description |
|-------------|---------------|---------|-----------|------|--|
| 0 | U1 | - | dgnssMode | - | Specifies differential mode: 2: RTK float: No attempts are made to fix ambiguities. 3: RTK fixed: Ambiguities are fixed whenever possible. |
| 1 | U1[3] | - | reserved1 | - | Reserved |

31.11.5 UBX-CFG-DOSC (0x06 0x61)

31.11.5.1 Disciplined oscillator configuration

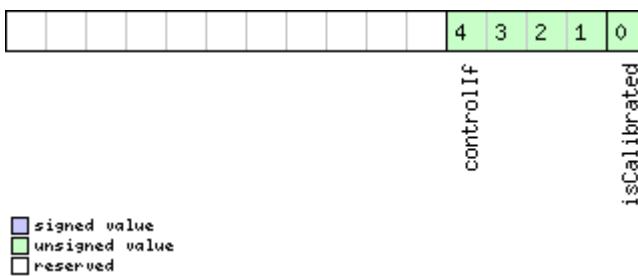

| | | | | | | |
|---|--|----------------|-----------------|-----------------------|--|---------------------|
| <i>Message</i> | CFG-DOSC | | | | | |
| <i>Description</i> | Disciplined oscillator configuration | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 16 up to version 23.01 (only with Time & Frequency Sync products) | | | | | |
| <i>Type</i> | Get/Set | | | | | |
| <i>Comment</i> | <p>This message allows the characteristics of the internal or external oscillator to be described to the receiver.</p> <p>The gainVco and gainUncertainty parameters are normally set using the calibration process initiated using UBX-TIM-VCOCAL.</p> <p>The behavior of the system can be badly affected by setting the wrong values, so customers are advised to only change these parameters with care.</p> | | | | | |
| <i>Message Structure</i> | <i>Header</i> | <i>Class</i> | <i>ID</i> | <i>Length (Bytes)</i> | | <i>Payload</i> |
| | 0xB5 | 0x62 | 0x06 | 0x61 | 4 + 32*numOsc | see below CK_A CK_B |

|------------------------------|---------------|---------|------|------|-------------|
| <i>End of repeated block</i> | | | | | |

Bitfield flags

This graphic explains the bits of flags

| Name | Description |
|--------------|---|
| isCalibrated | 1 if the oscillator gain is calibrated, 0 if not |
| controlIf | Communication interface for oscillator control: 0: Custom DAC attached to receiver's I2C 1: Microchip MCP4726 (12 bit DAC) attached to receiver's I2C 2: TI DAC8571 (16 bit DAC) attached to receiver's I2C 13: 12 bit DAC attached to host 14: 14 bit DAC attached to host 15: 16 bit DAC attached to host Note that for DACs attached to the host, the host must monitor TIM-DOSC messages and pass the supplied raw values on to the DAC. |

31.11.6 UBX-CFG-DYNSEED (0x06 0x85)

31.11.6.1 Programming the dynamic seed for the host interface signature

| Message | CFG-DYNSEED | | | | | |
|-------------------|---|---------|-----------|----------------|---|---------------------|
| Description | Programming the dynamic seed for the host interface signature | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 18 up to version 23.01 | | | | | |
| Type | Set | | | | | |
| Comment | The message can be used to program the dynamic seed for the host interface signature. If successfully configured, the message will answer with ACK, otherwise with NAK. Before the first programming, it is assumed that the dynamic seed is all '0'. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |

31.11.7 UBX-CFG-ESRC (0x06 0x60)

31.11.7.1 External synchronization source configuration

| | | | | | | |
|--|---|---------|------------|----------------|---|---------------------|
| Message | CFG-ESRC | | | | | |
| Description | External synchronization source configuration | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 16 up to version 23.01 (only with Time & Frequency Sync products) | | | | | |
| Type | Get/Set | | | | | |
| Comment | External time or frequency source configuration. The stability of time and frequency sources is described using different fields, see sourceType field documentation. | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 | 0x62 | 0x06 | 0x60 | 4 + 36*numSources | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | version | - | Message version (0 for this version) | |
| 1 | U1 | - | numSources | - | Number of sources (affects length of this message) | |
| 2 | U1[2] | - | reserved1 | - | Reserved | |
| Start of repeated block (numSources times) | | | | | | |
| 4 + 36*N | U1 | - | extInt | - | EXTINT index of this source (0 for EXTINT0 and 1 for EXTINT1) | |
| 5 + 36*N | U1 | - | sourceType | - | Source type: 0: none 1: frequency source; use withTemp, withAge, timeToTemp and maxDevLifeTime to describe the stability of the source 2: time source; use offset, offsetUncertainty and jitter fields to describe the stability of the source 3: feedback from external oscillator; stability data is taken from the external oscillator's configuration | |
| 6 + 36*N | X2 | - | flags | - | Flags (see graphic below) | |
| 8 + 36*N | U4 | 2^-2 | freq | Hz | Nominal frequency of source | |
| 12 + 36*N | U1[4] | - | reserved2 | - | Reserved | |
| 16 + 36*N | U4 | 2^-8 | withTemp | ppb | Oscillator stability limit over operating temperature range (must be > 0) Only used if sourceType is 1. | |
| 20 + 36*N | U4 | 2^-8 | withAge | ppb/yea | Oscillator stability with age (must be > 0) Only used if sourceType is 1. | |
| 24 + 36*N | U2 | - | timeToTemp | s | The minimum time that it could take for a temperature variation to move the oscillator frequency by 'withTemp' (must be > 0) Only used if sourceType is 1. | |

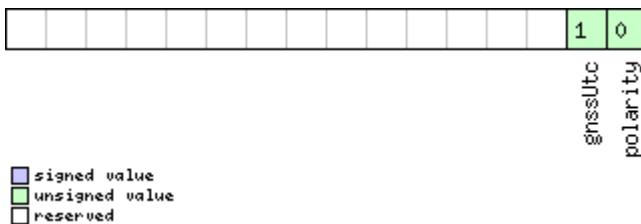

CFG-ESRC continued

| Byte Offset | Number Format | Scaling | Name | Unit | Description |
|-------------|---------------|---------|-------------------|------|---|
| 26 + 36*N | U2 | - | maxDevLifeTime | ppb | Maximum frequency deviation during lifetime (must be > 0) Only used if sourceType is 1. |
| 28 + 36*N | I4 | - | offset | ns | Phase offset of signal Only used if sourceType is 2. |
| 32 + 36*N | U4 | - | offsetUncertainty | ns | Uncertainty of phase offset (one standard deviation) Only used if sourceType is 2. |
| 36 + 36*N | U4 | - | jitter | ns/s | Phase jitter (must be > 0) Only used if sourceType is 2. |

End of repeated block

Bitfield flags

This graphic explains the bits of flags

signed value

unsigned value

reserved

| Name | Description |
|----------|---|
| polarity | Polarity of signal: 0: leading edge is rising edge 1: leading edge is falling edge |
| gnssUtc | Time base of timing signal: 0: GNSS - as specified in CFG-TP5 (or GPS if CFG-TP5 indicates UTC) 1: UTC Only used if sourceType is 2. |

31.11.8 UBX-CFG-FIXSEED (0x06 0x84)

31.11.8.1 Programming the fixed seed for host interface signature

| | | | | | | |
|-------------------|--|-------|------|----------------|----------------|---------------------|
| Message | CFG-FIXSEED | | | | | |
| Description | Programming the fixed seed for host interface signature | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 18 up to version 23.01 | | | | | |
| Type | Set | | | | | |
| Comment | The message can be used to program the fixed seed for the host interface signature. Moreover it will configure the set of messages that will be signed (min. 1, max. 10). If the class ID of the message is 0 the configuration is ignored for that message. If successfully configured, the message will answer with ACK, otherwise with NAK. See the configuring the fixed seed and register messages description for feature details. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x06 | 0x84 | 12 + 2 *length | see below CK_A CK_B |

| Payload Contents: | | | | | |
|---|---------------|---------|-----------|------|---|
| Byte Offset | Number Format | Scaling | Name | Unit | Description |
| 0 | U1 | - | version | - | Message version (0x02 for this version) |
| 1 | U1 | - | length | - | Number of registered messages (min. 1, max. 10) |
| 2 | U1[2] | - | reserved1 | - | Reserved |
| 4 | U4 | - | seedHi | - | high word of fixed seed |
| 8 | U4 | - | seedLo | - | low word of fixed seed |
| <i>Start of repeated block (length times)</i> | | | | | |
| 12 + 2*N | U1 | - | classId | - | Class ID on the message |
| 13 + 2*N | U1 | - | msgId | - | Message ID on the message |
| <i>End of repeated block</i> | | | | | |

31.11.9 UBX-CFG-GEOFENCE (0x06 0x69)

31.11.9.1 Geofencing configuration

| | | | | | |
|-------------------|---|-------|------|------------------|---------------------|
| Message | CFG-GEOFENCE | | | | |
| Description | Geofencing configuration | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 18 up to version 23.01 | | | | |
| Type | Get/Set | | | | |
| Comment | Gets or sets the geofencing configuration See the Geofencing description for feature details. If the receiver is sent a valid new configuration, it will respond with a UBX-ACK-ACK message and immediately change to the new configuration. Otherwise the receiver will reject the request, by issuing a UBX-ACK-NAK and continuing operation with the previous configuration. Note that the acknowledge message does not indicate whether the PIO configuration has been successfully applied (pin assigned), it only indicates the successful configuration of the feature. The configured PIO must be previously unoccupied for successful assignment. | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload Checksum |
| | 0xB5 0x62 | 0x06 | 0x69 | 8 + 12*numFences | see below CK_A CK_B |

Payload Contents:

| Byte Offset | Number Format | Scaling | Name | Unit | Description |
|-------------|---------------|---------|-----------|------|--|
| 0 | U1 | - | version | - | Message version (=0x00 for this version) |
| 1 | U1 | - | numFences | - | Number of geofences contained in this message. Note that the receiver can only store a limited number of geofences (currently 4). |
| 2 | U1 | - | confLvl | - | Required confidence level for state evaluation. This value times the position's standard deviation (sigma) defines the confidence band. 0=no confidence required, 1=68%, 2=95%, 3=99.7% etc. |
| 3 | U1[1] | - | reserved1 | - | Reserved |

CFG-GEOFENCE continued

| Byte Offset | Number Format | Scaling | Name | Unit | Description |

| 12 + 12*N | I4 | 1e-7 | lon | deg | Longitude of the geofence circle center |
| 16 + 12*N | U4 | 1e-2 | radius | m | Radius of the geofence circle |
| <i>End of repeated block</i> | | | | | |

31.11.10 UBX-CFG-GNSS (0x06 0x3E)

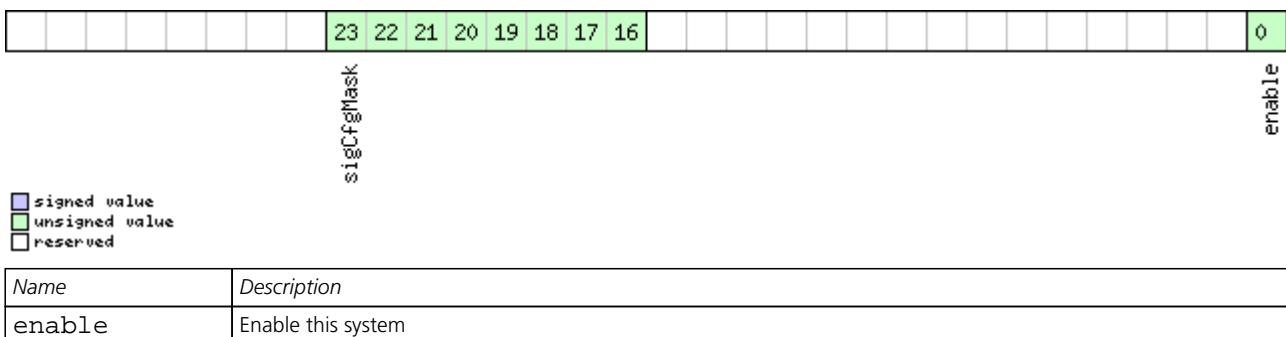

31.11.10.1 GNSS system configuration

| | | | | | |
|-------------|--|-------|----|----------------|------------------|
| Message | CFG-GNSS | | | | |
| Description | GNSS system configuration | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | |
| Type | Get/Set | | | | |
| Comment | <p>Gets or sets the GNSS system channel sharing configuration. If the receiver is sent a valid new configuration, it will respond with a UBX-ACK-ACK message and immediately change to the new configuration. Otherwise the receiver will reject the request, by issuing a UBX-ACK-NAK and continuing operation with the previous configuration.</p> <p>Configuration requirements:</p> <ul style="list-style-type: none"> It is necessary for at least one major GNSS to be enabled, after applying the new configuration to the current one. It is also required that at least 4 tracking channels are available to each enabled major GNSS, i.e. <code>maxTrkCh</code> must have a minimum value of 4 for each enabled major GNSS. The number of tracking channels in use must not exceed the number of tracking channels available in hardware, and the sum of all reserved tracking channels needs to be less than or equal to the number of tracking channels in use. <p>Notes:</p> <ul style="list-style-type: none"> To avoid cross-correlation issues, it is recommended that GPS and QZSS are always both enabled or both disabled. Polling this message returns the configuration of all supported GNSS, whether enabled or not; it may also include GNSS unsupported by the particular product, but in such cases the enable flag will always be unset. See section GNSS Configuration for a discussion of the use of this message and section Satellite Numbering for a description of the GNSS IDs available. Configuration specific to the GNSS system can be done via other messages (e.g. UBX-CFG-SBAS). | | | | |

31.11.12 UBX-CFG-INF (0x06 0x02)

31.11.12.1 Poll configuration for one protocol

| | | | | | | |
|-------------------|--|---------|------------|----------------|---|---------------------|
| Message | CFG-INF | | | | | |
| Description | Poll configuration for one protocol | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Poll Request | | | | | |
| Comment | - | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x06 | 0x02 | 1 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | protocolID | - | Protocol Identifier, identifying the output protocol for this Poll Request. The following are valid Protocol Identifiers: 0: UBX Protocol 1: NMEA Protocol 2-255: Reserved | |

31.11.12.2 Information message configuration

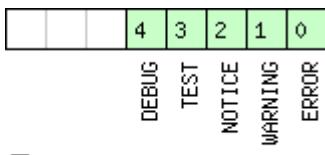

| | | | | | | |
|-----------------------------------|---|---------|------------|----------------|---|---------------------|
| Message | CFG-INF | | | | | |
| Description | Information message configuration | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Get/Set | | | | | |
| Comment | The value of infMsgMask[x] below are that each bit represents one of the INF class messages (Bit 0 for ERROR, Bit 1 for WARNING and so on.). For a complete list, see the Message Class INF . Several configurations can be concatenated to one input message. In this case the payload length can be a multiple of the normal length. Output messages from the module contain only one configuration unit. Note that I/O Ports 1 and 2 correspond to serial ports 1 and 2. I/O port 0 is DDC. I/O port 3 is USB. I/O port 4 is SPI. I/O port 5 is reserved for future use. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |

31.11.14 UBX-CFG-LOGFILTER (0x06 0x47)

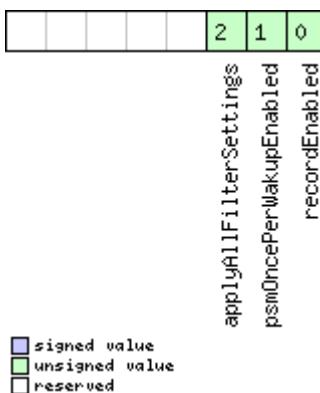

31.11.14.1 Data Logger Configuration

| | |
|-------------|--|
| Message | CFG-LOGFILTER |
| Description | Data Logger Configuration |
| Firmware | Supported on: <ul style="list-style-type: none">• u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 |
| Type | Get/Set |
| Comment | <p>This message can be used to configure the data logger, i.e. to enable/disable the log recording and to get/set the position entry filter settings.</p> <p>Position entries can be filtered based on time difference, position difference or current speed thresholds. Position and speed filtering also have a minimum time interval. A position is logged if any of the thresholds are exceeded. If a threshold is set to zero it is ignored. The maximum rate of position logging is 1Hz.</p> <p>The filter settings will be configured to the provided values only if the 'applyAllFilterSettings' flag is set. This allows the recording to be enabled/disabled independently of configuring the filter settings.</p> |

| | It is supported to configure the data logger in the absence of a logging file. By doing so, once the logging file is created, the data logger configuration will take effect immediately and logging recording and filtering will activate according to the configuration. | | | | | |
|-------------------|--|---------|-------------------|------|---|--|
| Message Structure | Header | | Class | ID | Length (Bytes) | |
| | 0xB5 | 0x62 | 0x06 | 0x47 | 12 | |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | version | - | The version of this message. Set to 1 | |
| 1 | X1 | - | flags | - | Flags (see graphic below) | |
| 2 | U2 | - | minInterval | s | Minimum time interval between logged positions (0 = not set). This is only applied in combination with the speed and/or position thresholds. If both minInterval and timeThreshold are set, minInterval must be less than or equal to timeThreshold. | |
| 4 | U2 | - | timeThreshold | s | If the time difference is greater than the threshold then the position is logged (0 = not set). | |
| 6 | U2 | - | speedThreshold | m/s | If the current speed is greater than the threshold then the position is logged (0 = not set). minInterval also applies | |
| 8 | U4 | - | positionThreshold | m | If the 3D position difference is greater than the threshold then the position is logged (0 = not set). minInterval also applies | |

Bitfield flags

This graphic explains the bits of flags

| Name | Description |
|-------------------------|--|
| recordEnabled | 1 = enable recording, 0 = disable recording |
| psmOncePerWakeupEnabled | 1 = enable recording only one single position per PSM on/off mode wake-up period, 0 = disable once per wake-up |
| applyAllFilterSettings | 1 = apply all filter settings, 0 = only apply recordEnabled |

31.11.15 UBX-CFG-MSG (0x06 0x01)

31.11.15.1 Poll a message configuration

| | | | | | | |
|-------------------|--|---------|----------|----------------|--------------------|-----------|
| Message | CFG-MSG | | | | | |
| Description | Poll a message configuration | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Poll Request | | | | | |
| Comment | - | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 0x62 | 0x06 | 0x01 | 2 | see below | CK_A CK_B |

31.11.20.2 Extended Power Management configuration

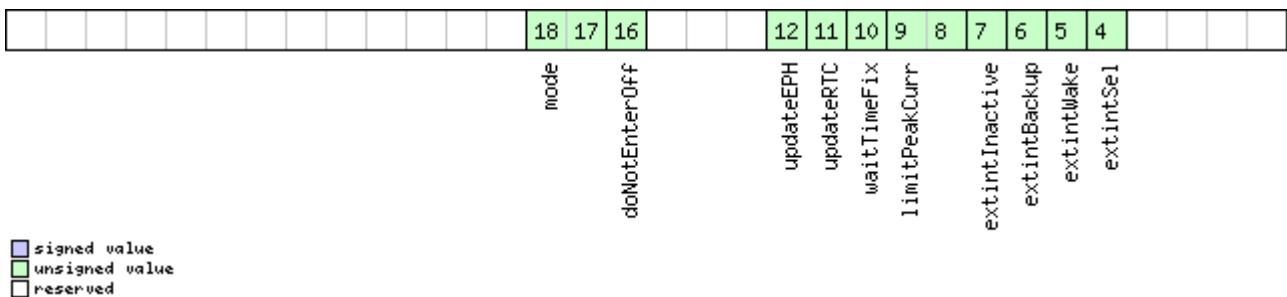

| | | | | | | |
|-------------------|--|---------|--------------------|----------------|---|---------------------|
| Message | CFG-PM2 | | | | | |
| Description | Extended Power Management configuration | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 18 up to version 23.01 | | | | | |
| Type | Get/Set | | | | | |
| Comment | This feature is not supported for either the ADR or FTS products. - | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x06 | 0x3B | 48 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | version | - | Message version (0x02 for this version) | |
| 1 | U1 | - | reserved1 | - | Reserved | |
| 2 | U1 | - | maxStartupStateDur | s | Maximum time to spend in Acquisition state. If 0: bound disabled (see maxStartupStateDur). (not supported in protocol versions less than 17), (not supported in protocol versions 23 to 23.01) | |
| 3 | U1 | - | reserved2 | - | Reserved | |
| 4 | X4 | - | flags | - | PSM configuration flags (see graphic below) | |
| 8 | U4 | - | updatePeriod | ms | Position update period. If set to 0, the receiver will never retry a fix and it will wait for external events | |
| 12 | U4 | - | searchPeriod | ms | Acquisition retry period if previously failed. If set to 0, the receiver will never retry a startup (not supported in protocol versions 23 to 23.01) | |

CFG-PM2 continued

| Byte Offset | Number Format | Scaling | Name | Unit | Description |
|-------------|---------------|---------|--------------------|------|---|
| 16 | U4 | - | gridOffset | ms | Grid offset relative to GPS start of week (not supported in protocol versions 23 to 23.01) |
| 20 | U2 | - | onTime | s | Time to stay in <i>Tracking</i> state (not supported in protocol versions 23 to 23.01) |
| 22 | U2 | - | minAcqTime | s | minimal search time |
| 24 | U1[20] | - | reserved3 | - | Reserved |
| 44 | U4 | - | extintInactivityMs | ms | inactivity time out on EXTINT pint if enabled |

Bitfield flags

This graphic explains the bits of `flags`

| Name | Description |
|-----------------------------|---|
| <code>extintSel</code> | EXTINT Pin Select 0 EXTINT0 1 EXTINT1 |
| <code>extintWake</code> | EXTINT Pin Control 0 disabled 1 enabled, keep receiver awake as long as selected EXTINT pin is 'high' |
| <code>extintBackup</code> | EXTINT Pin Control 0 disabled 1 enabled, force receiver into BACKUP mode when selected EXTINT pin is 'low' |
| <code>extintInactive</code> | EXTINT Pin Control 0 disabled 1 enabled, Force backup in case EXTINT Pin is inactive for time longer than <code>extintInactivityMs</code> |
| <code>limitPeakCurr</code> | Limit Peak Current 00 disabled 01 enabled, peak current is limited 10 reserved 11 reserved |
| <code>waitTimeFix</code> | Wait for Timefix (see waitTimeFix) 0 wait for normal fix ok before starting on time 1 wait for time fix ok before starting on time (not supported in protocol versions 23 to 23.01) |
| <code>updateRTC</code> | Update Real Time Clock (see updateRTC) 0 Do not wake up to update RTC. RTC is updated during normal on-time. 1 Update RTC. The receiver adds extra wake-up cycles to update the RTC. (not supported in protocol versions 23 to 23.01) |

Bitfield flags Description continued

| Name | Description |
|---------------|---|
| updateEPH | Update Ephemeris (see updateEPH) 0 Do not wake up to update Ephemeris data 1 Update Ephemeris. The receiver adds extra wake-up cycles to update the Ephemeris data |

31.11.21 UBX-CFG-PMS (0x06 0x86)

31.11.21.1 Power Mode Setup

| | | | | | | |
|-------------------|--|---------|-----------------|----------------|---|-----------|
| Message | CFG-PMS | | | | | |
| Description | Power Mode Setup | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 18 up to version 23.01 | | | | | |
| Type | Get/Set | | | | | |
| Comment | - | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 0x62 | 0x06 | 0x86 | 8 | see below | CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | version | - | Message version (0x00 for this version) | |
| 1 | U1 | - | powerSetupValue | - | Power setup value 0x00 -> Full power 0x01 -> Balanced 0x02 -> Interval 0x03 -> Aggressive with 1Hz 0x04 -> Aggressive with 2Hz 0x05 -> Aggressive with 4Hz 0xFF -> Invalid (only when polling) | |
| 2 | U2 | - | period | s | Position update period and search period. Recommended minimum period is 10s, although the receiver accepts any value bigger than 5s. Only valid when powerSetupValue set to '0'. Interval, otherwise must be set to '0'. | |

CFG-PMS continued

| Byte Offset | Number Format | Scaling | Name | Unit | Description |
|-------------|---------------|---------|-----------|------|--|
| 4 | U2 | - | onTime | s | Duration of the ON phase, must be smaller than the period. Only valid when powerSetupValue set to Interval, otherwise must be set to '0'. |
| 6 | U1[2] | - | reserved1 | - | Reserved |

31.11.22 UBX-CFG-PRT (0x06 0x00)

31.11.22.1 Polls the configuration for one I/O Port

| | | | | | | |
|-------------------|--|---------|--------|----------------|---|---------------------|
| Message | CFG-PRT | | | | | |
| Description | Polls the configuration for one I/O Port | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Poll Request | | | | | |
| Comment | Sending this message with a port ID as payload results in having the receiver return the configuration for the specified port. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x06 | 0x00 | 1 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | PortID | - | Port Identifier Number (see the other versions of CFG-PRT for valid values) | |

31.11.22.2 Port Configuration for UART

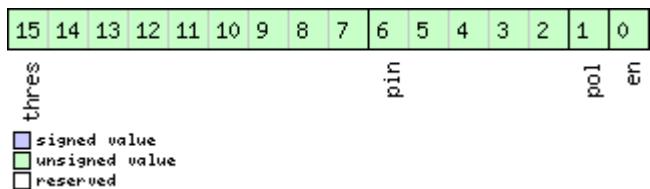

| | | | | | | |
|-------------------|---|-------|------|----------------|---------|---------------------|
| Message | CFG-PRT | | | | | |
| Description | Port Configuration for UART | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Get/Set | | | | | |
| Comment | Several configurations can be concatenated to one input message. In this case the payload length can be a multiple of the normal length (see the other versions of CFG-PRT). Output messages from the module contain only one configuration unit. Note that this message can affect baud rate and other transmission parameters. Because there may be messages queued for transmission there may be uncertainty about which protocol applies to such messages. In addition a message currently in transmission may be corrupted by a protocol change. Host data reception parameters may have to be changed to be able to receive future messages, including the acknowledge message resulting from the CFG-PRT message. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x06 | 0x00 | 20 | see below CK_A CK_B |
| Payload Contents: | | | | | | |

31.11.24 UBX-CFG-RATE (0x06 0x08)

31.11.24.1 Navigation/Measurement Rate Settings

| | | | | | | |
|-------------|--|--|--|--|--|--|
| Message | CFG-RATE | | | | | |
| Description | Navigation/Measurement Rate Settings | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Get/Set | | | | | |
| Comment | This feature is not supported for the FTS product variant. This message allows the user to alter the rate at which navigation solutions (and the measurements that they depend on) are generated by the receiver. The calculation of the navigation solution will always be aligned to the top of a second zero (first second of the week) of the configured reference time system. For protocol version 18 and later the navigation period is an integer multiple of the measurement period. <ul style="list-style-type: none"> • Each measurement triggers the measurements generation and raw data output. • The navRate value defines that every nth measurement triggers a navigation epoch. • The update rate has a direct influence on the power consumption. The more fixes that are required, the more CPU power and communication resources are required. • For most applications a 1 Hz update rate would be sufficient. • When using Power Save Mode, measurement and navigation rate can differ from the values configured here. See Measurement and navigation rate with Power Save Mode | | | | | |

| | for details. | | | | | |
|-------------------|---------------|---------|----------|----------------|--------|---|
| Message Structure | Header | Class | ID | Length (Bytes) | | Payload Checksum |
| | 0xB5 | 0x62 | 0x06 | 0x08 | 6 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | | Unit | Description |
| 0 | U2 | - | measRate | | ms | The elapsed time between GNSS measurements, which defines the rate, e.g. 100ms => 10Hz, 1000ms => 1Hz, 10000ms => 0.1Hz |
| 2 | U2 | - | navRate | | cycles | The ratio between the number of measurements and the number of navigation solutions, e.g. 5 means five measurements for every navigation solution. Max. value is 127. (This parameter is ignored and the navRate is fixed to 1 in protocol versions less than 18) |
| 4 | U2 | - | timeRef | | - | The time system to which measurements are aligned: 0: UTC time 1: GPS time 2: GLONASS time (not supported in protocol versions less than 18) 3: BeiDou time (not supported in protocol versions less than 18) 4: Galileo time (not supported in protocol versions less than 18) |

31.11.25.1 Contents of Remote Inventory

| Message | CFG-RINV | | | | | |
|-----------------------------------|--|---------|-------|----------------|---------|--|
| Description | Contents of Remote Inventory | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Get/Set | | | | | |
| Comment | If N is greater than 30, the excess bytes are discarded. In future firmware versions, this limit may change. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | | Payload Checksum |
| | 0xB5 | 0x62 | 0x06 | 0x34 | 1 + 1*N | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | | Unit | Description |
| 0 | X1 | - | flags | | - | Flags (see graphic below) |
| Start of repeated block (N times) | | | | | | |
| 1 + 1*N | U1 | - | data | | - | Data to store/stored in Remote Inventory |
| End of repeated block | | | | | | |

Bitfield flags

This graphic explains the bits of flags

| Name | Description |
|--------|--|
| dump | Dump data at startup. Does not work if flag binary is set. |
| binary | Data is binary |

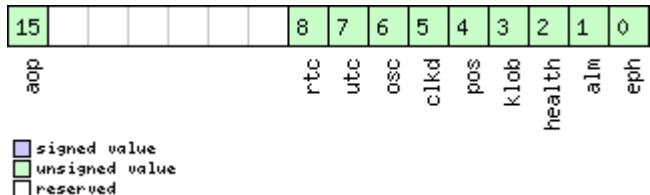

31.11.26 UBX-CFG-RST (0x06 0x04)

31.11.26.1 Reset Receiver / Clear Backup Data Structures

| | | | | | | |
|-------------------|---|---------|------------|----------------|--|---------------------|
| Message | CFG-RST | | | | | |
| Description | Reset Receiver / Clear Backup Data Structures | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Command | | | | | |
| Comment | Don't expect this message to be acknowledged by the receiver. • Newer FW version won't acknowledge this message at all. • Older FW version will acknowledge this message but the acknowledge may not be sent completely before the receiver is reset. | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 | 0x62 | 0x06 | 0x04 | 4 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | X2 | - | navBbrMask | - | BBR Sections to clear. The following Special Sets apply: 0x0000 Hot start 0x0001 Warm start 0xFFFF Cold start (see graphic below) | |
| 2 | U1 | - | resetMode | - | Reset Type 0x00 - Hardware reset (Watchdog) immediately 0x01 - Controlled Software reset 0x02 - Controlled Software reset (GNSS only) 0x04 - Hardware reset (Watchdog) after shutdown 0x08 - Controlled GNSS stop 0x09 - Controlled GNSS start | |
| 3 | U1 | - | reserved1 | - | Reserved | |

Bitfield navBbrMask

This graphic explains the bits of `navBbrMask`

| Name | Description |
|--------|--|
| eph | Ephemeris |
| alm | Almanac |
| health | Health |
| klob | Klobuchar parameters |
| pos | Position |
| clkd | Clock Drift |
| osc | Oscillator Parameter |
| utc | UTC Correction + GPS Leap Seconds Parameters |
| rtc | RTC |
| aop | Autonomous Orbit Parameters |

31.11.27 UBX-CFG-RXM (0x06 0x11)

31.11.27.1 RXM configuration

| | | | | | | |
|-------------------|---|---------|-----------|----------------|---|-----------|
| Message | CFG-RXM | | | | | |
| Description | RXM configuration | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 17 | | | | | |
| Type | Get/Set | | | | | |
| Comment | For a detailed description see section Power Management . Note that Power Save Mode cannot be selected when the receiver is configured to process GLONASS signals (using CFG-GNSS). | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 0x62 | 0x06 | 0x11 | 2 | see below | CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | reserved1 | - | Reserved | |
| 1 | U1 | - | lpMode | - | Low Power Mode 0: Continuous Mode 1: Power Save Mode 4: Continuous Mode Note that for receivers with protocol versions larger or equal to 14, both Low Power Mode settings 0 and 4 configure the receiver to Continuous Mode. | |

31.11.27.2 RXM configuration

| | | | | | | |
|-------------------|--|---------|-----------|----------------|--|---------------------|
| Message | CFG-RXM | | | | | |
| Description | RXM configuration | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 18 up to version 23.01 | | | | | |
| Type | Get/Set | | | | | |
| Comment | For a detailed description see section Power Management . | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 | 0x62 | 0x06 | 0x11 | 2 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | reserved1 | - | Reserved | |
| 1 | U1 | - | lpMode | - | Low Power Mode 0: Continuous Mode 1: Power Save Mode 4: Continuous Mode | |

31.11.28 UBX-CFG-SBAS (0x06 0x16)

31.11.28.1 SBAS Configuration

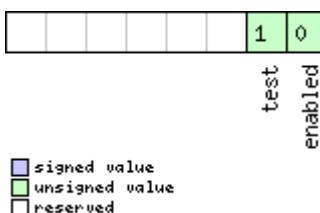

| | | | | | | |
|-------------------|---|---------|-----------|----------------|--|---------------------|
| Message | CFG-SBAS | | | | | |
| Description | SBAS Configuration | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Get/Set | | | | | |
| Comment | This message configures the SBAS receiver subsystem (i.e. WAAS, EGNOS, MSAS). See the SBAS Configuration Settings Description for a detailed description of how these settings affect receiver operation. | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 | 0x62 | 0x06 | 0x16 | 8 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | X1 | - | mode | - | SBAS Mode (see graphic below) | |
| 1 | X1 | - | usage | - | SBAS Usage (see graphic below) | |
| 2 | U1 | - | maxSBAS | - | Maximum Number of SBAS prioritized tracking channels (valid range: 0 - 3) to use (obsolete and superseeded by UBX-CFG-GNSS in protocol versions 14+). | |
| 3 | X1 | - | scanmode2 | - | Continuation of scanmode bitmask below (see graphic below) | |

CFG-SBAS continued

| Byte Offset | Number Format | Scaling | Name | Unit | Description |
|-------------|---------------|---------|-----------|------|--|
| 4 | X4 | - | scanmode1 | - | <p>Which SBAS PRN numbers to search for (Bitmask)</p> <p>If all Bits are set to zero, auto-scan (i.e. all valid PRNs) are searched.</p> <p>Every bit corresponds to a PRN number (see graphic below)</p> |

Bitfield mode

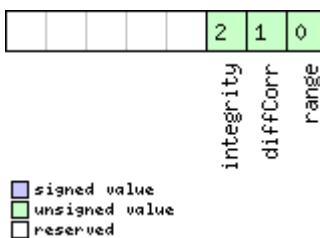

This graphic explains the bits of mode

| Name | Description |
|---------|---|
| enabled | SBAS Enabled (1) / Disabled (0) - This field is deprecated; use UBX-CFG-GNSS to enable/disable SBAS operation |
| test | SBAS Testbed: Use data anyhow (1) / Ignore data when in Test Mode (SBAS Msg 0) |

Bitfield usage

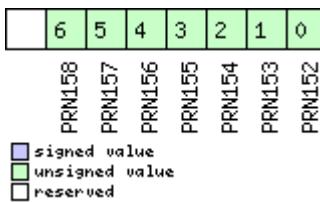

This graphic explains the bits of usage

| Name | Description |
|-----------|--|
| range | Use SBAS GEOs as a ranging source (for navigation) |
| diffCorr | Use SBAS Differential Corrections |
| integrity | Use SBAS Integrity Information |

Bitfield scanmode2

This graphic explains the bits of scanmode2

Bitfield scanmode1

This graphic explains the bits of scanmode1

31.11.29 UBX-CFG-SMGR (0x06 0x62)

31.11.29.1 Synchronization manager configuration

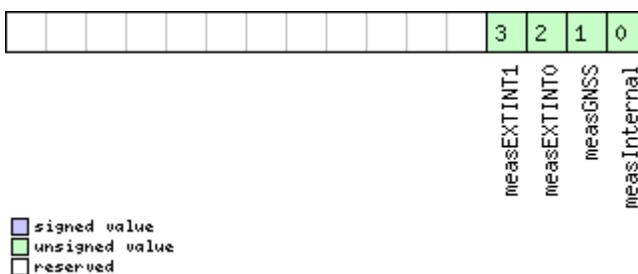

| Message | CFG-SMGR | | | | | |
|-------------------|---|---------|--------------------|----------------|--|---------------------|
| Description | Synchronization manager configuration | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 16 up to version 23.01 (only with Time & Frequency Sync products) | | | | | |
| Type | Get/Set | | | | | |
| Comment | - | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | | Payload Checksum |
| | 0xB5 | 0x62 | 0x06 | 0x62 | 20 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | version | - | Message version (0 for this version) | |
| 1 | U1 | - | minGNSSFix | - | Minimum number of GNSS fixes before we commit to use it as a source | |
| 2 | U2 | - | maxFreqChange Rate | ppb/s | Maximum frequency change rate during disciplining. Must not exceed 30ppb/s | |
| 4 | U2 | - | maxPhaseCorrRate | ns/s | Maximum phase correction rate in coherent time pulse mode. For maximum phase correction rate in corrective time pulse mode see maxSlewRate. Note that in coherent time pulse mode phase correction is achieved by intentional frequency offset. Allowing for a high phase correction rate can result in large intentional frequency offset. Must not exceed 100ns/s | |
| 6 | U1[2] | - | reserved1 | - | Reserved | |
| 8 | U2 | - | freqTolerance | ppb | Limit of possible deviation from nominal before TIM-TOS indicates that frequency is out of tolerance | |
| 10 | U2 | - | timeTolerance | ns | Limit of possible deviation from nominal before TIM-TOS indicates that time pulse is out of tolerance | |
| 12 | X2 | - | messageCfg | - | Sync manager message configuration (see graphic below) | |

CFG-SMGR continued

| Byte Offset | Number Format | Scaling | Name | Unit | Description |
|-------------|---------------|---------|-------------|------|---|
| 14 | U2 | - | maxSlewRate | us/s | Maximum slew rate, the maximum time correction that shall be applied between locked pulses in corrective time pulse mode. To have no limit on the slew rate, set the flag disableMaxSlewRate to 1 For maximum phase correction rate in coherent time pulse mode see maxPhaseCorrRate. |
| 16 | X4 | - | flags | - | Flags (see graphic below) |

Bitfield messageCfg

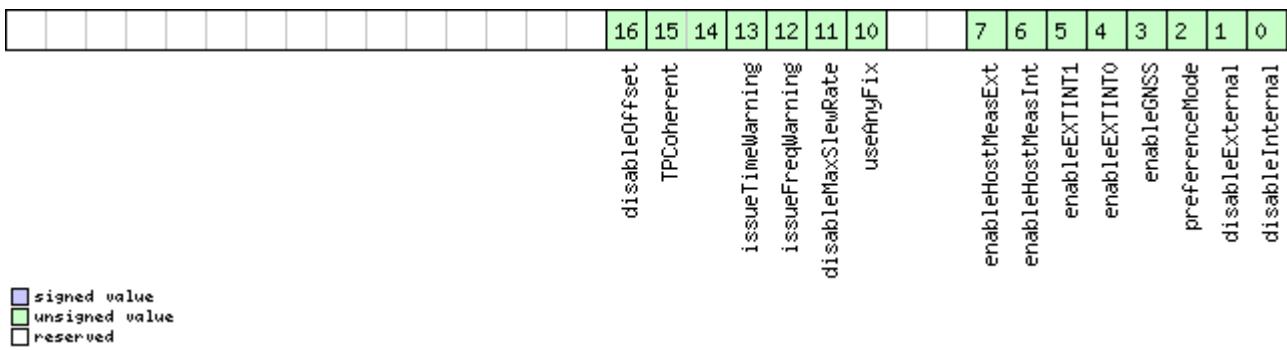

This graphic explains the bits of `messageCfg`

| Name | Description |
|---------------------------|--|
| <code>measInternal</code> | 1 = report the estimated offset of the internal oscillator based on the oscillator model |
| <code>measGNSS</code> | 1 = report the internal oscillator's offset relative to GNSS |
| <code>measEXTINT0</code> | 1 = report the internal oscillator's offset relative to the source on EXTINT0 |
| <code>measEXTINT1</code> | 1 = report the internal oscillator's offset relative to the source on EXTINT1 |

Bitfield flags

This graphic explains the bits of `flags`

| Name | Description |
|------------------------------|---|
| <code>disableInternal</code> | 1 = disable disciplining of the internal oscillator |
| <code>disableExternal</code> | 1 = disable disciplining of the external oscillator |

Bitfield flags Description continued

| Name | Description |
|--------------------|---|
| preferenceMode | Reference selection preference 0 - best frequency accuracy 1 - best phase accuracy |
| enableGNSS | 1 = enable use of GNSS as synchronization source |
| enableEXTINT0 | 1 = enable use of EXTINT0 as synchronization source |
| enableEXTINT1 | 1 = enable use of EXTINT1 as synchronization source |
| enableHostMeasInt | 1 = enable use of host measurements on the internal oscillator as synchronization source Measurements made by the host must be sent to the receiver using a TIM-SMEAS-DATA0 message. |
| enableHostMeasExt | 1 = enable use of host measurements on the external oscillator as synchronization source Measurements made by the host must be sent to the receiver using a TIM-SMEAS-DATA0 message. |
| useAnyFix | 0 - use over-determined navigation solutions only 1 - use any fix |
| disableMaxSlewRate | 0 - use the value in the field maxSlewRate for maximum time correction in corrective time pulse mode 1 - don't use the value in the field maxSlewRate |
| issueFreqWarning | 1 = issue a warning (via TIM-TOS flag) when frequency uncertainty exceeds freqTolerance |
| issueTimeWarning | 1 = issue a warning (via TIM-TOS flag) when time uncertainty exceeds timeTolerance |
| TPCoherent | Control time pulse coherency 0 - Coherent pulses. Time phase offsets will be corrected gradually by varying the GNSS oscillator rate within frequency tolerance limits. There will always be the correct number of GNSS oscillator cycles between time pulses. Given tight limits this may take a long time 1 - Non-coherent pulses. In this mode the receiver will correct time phase offsets as quickly as allowed by the specified maximum slew rate, in which case there may not be the expected number of GNSS oscillator cycles between time pulses. 2 - Post-initialization coherent pulses. The receiver will run in non-coherent mode as described above until the pulse timing has been corrected and PLL is active on the internal oscillator, but will then switch to coherent pulse mode. |
| disableOffset | 1 = disable automatic storage of oscillator offset |

31.11.30 UBX-CFG-TMODE2 (0x06 0x3D)

31.11.30.1 Time Mode Settings 2

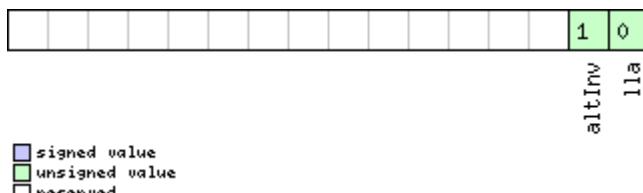

| | | | | | | |
|-------------------|--|-------|------|----------------|---------|---------------------|
| Message | CFG-TMODE2 | | | | | |
| Description | Time Mode Settings 2 | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 (only with Time Sync or Time & Frequency Sync products) | | | | | |
| Type | Get/Set | | | | | |
| Comment | This message is available only for timing receivers See the Time Mode Description for details. This message replaces the deprecated UBX-CFG-TMODE message. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |

|-------------|---------------|---------|-------|------|--|
| 28 | X4 | - | flags | - | Configuration flags (see graphic below) |

Bitfield flags

This graphic explains the bits of flags

| Name | Description |
|----------------|--|
| active | if set enable time pulse; if pin assigned to another function, other function takes precedence |
| lockGpsFreq | if set synchronize time pulse to GPS as soon as GPS time is valid, otherwise use local clock |
| lockedOtherSet | if set use 'freqPeriodLock' and 'pulseLenRatioLock' as soon as GPS time is valid and 'freqPeriod' and 'pulseLenRatio' if GPS time is invalid, if flag is cleared 'freqPeriod' and 'pulseLenRatio' used regardless of GPS time |
| isFreq | if set 'freqPeriodLock' and 'freqPeriod' interpreted as frequency, otherwise interpreted as period |
| isLength | if set 'pulseLenRatioLock' and 'pulseLenRatio' interpreted as pulse length, otherwise interpreted as duty cycle |
| alignToTow | align pulse to top of second (period time must be integer fraction of 1s) |
| polarity | pulse polarity: 0 = falling edge at top of second 1 = rising edge at top of second |
| gridUtcGps | timegrid to use: 0 = UTC 1 = GPS |

31.11.32.4 Time Pulse Parameters

| 8 | U4 | - | freqPeriod | Hz_or_us | Frequency or period time, depending on setting of bit 'isFreq' |
| 12 | U4 | - | freqPeriodLoc_k | Hz_or_us | Frequency or period time when locked to GNSS time, only used if 'lockedOtherSet' is set |
| 16 | U4 | - | pulseLenRatio | us_or_2^-32 | Pulse length or duty cycle, depending on 'isLength' |
| 20 | U4 | - | pulseLenRatioLock | us_or_2^-32 | Pulse length or duty cycle when locked to GNSS time, only used if 'lockedOtherSet' is set |
| 24 | I4 | - | userConfigDelay | ns | User configurable time pulse delay |
| 28 | X4 | - | flags | - | Configuration flags (see graphic below) |

Bitfield flags

This graphic explains the bits of flags

| Name | Description |
|----------------|--|
| active | If set enable time pulse; if pin assigned to another function, other function takes precedence. Must be set for FTS variant. |
| lockGnssFreq | If set synchronize time pulse to GNSS as soon as GNSS time is valid. If not set, or before GNSS time is valid use local clock. This flag is ignored by the FTS product variant; in this case the receiver always locks to the best available time/frequency reference (which is not necessarily GNSS). |
| lockedOtherSet | If set the receiver switches between the timepulse settings given by 'freqPeriodLocked' & 'pulseLenLocked' and those given by 'freqPeriod' & 'pulseLen'. The 'Locked' settings are used where the receiver has an accurate sense of time. For non-FTS products, this occurs when GNSS solution with a reliable time is available, but for FTS products the setting syncMode field governs behavior. In all cases, the receiver only uses 'freqPeriod' & 'pulseLen' when the flag is unset. |
| isFreq | If set 'freqPeriodLock' and 'freqPeriod' are interpreted as frequency, otherwise interpreted as period. |
| isLength | If set 'pulseLenRatioLock' and 'pulseLenRatio' interpreted as pulse length, otherwise interpreted as duty cycle. |
| alignToTow | Align pulse to top of second (period time must be integer fraction of 1s). Also set 'lockGnssFreq' to use this feature. This flag is ignored by the FTS product variant; it is assumed to be always set (as is lockGnssFreq). Set maxSlewRate and maxPhaseCorrRate fields of CFG-SMGR to 0 to disable alignment. |

Bitfield flags Description continued

| Name | Description |
|-------------|--|
| polarity | Pulse polarity: 0: falling edge at top of second 1: rising edge at top of second |
| gridUtcGnss | Timegrid to use: 0: UTC 1: GPS 2: GLONASS 3: BeiDou 4: Galileo (not supported in protocol versions less than 18) This flag is only relevant if 'lockGnssFreq' and 'alignToTow' are set. Note that configured GNSS time is estimated by the receiver if locked to any GNSS system. If the receiver has a valid GNSS fix it will attempt to steer the TP to the specified time grid even if the specified time is not based on information from the constellation's satellites. To ensure timing based purely on a given GNSS, restrict the supported constellations in CFG-GNSS . |
| syncMode | Sync Manager lock mode to use: 0: switch to 'freqPeriodLock' and 'pulseLenRatioLock' as soon as Sync Manager has an accurate time, never switch back to 'freqPeriod' and 'pulseLenRatio' 1: switch to 'freqPeriodLock' and 'pulseLenRatioLock' as soon as Sync Manager has an accurate time, and switch back to 'freqPeriod' and 'pulseLenRatio' as soon as time gets inaccurate This field is only relevant for the FTS product variant. This field is only relevant if the flag 'lockedOtherSet' is set. |

31.11.33 UBX-CFG-TXSLot (0x06 0x53)

31.11.33.1 TX buffer time slots configuration

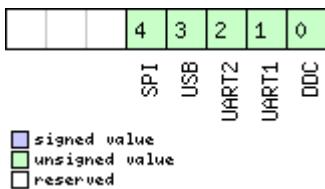

| Message | CFG-TXSLot | | | | | |
|-------------------|--|---------|---------|------|---|------------------|
| Description | TX buffer time slots configuration | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 16 up to version 23.01 (only with Time & Frequency Sync products) | | | | | |
| Type | Set | | | | | |
| Comment | This message configures how transmit time slots are defined for the receiver interfaces. These time slots are relative to the chosen time pulse. A receiver that supports this message offers 3 time slots: nr. 0, 1 and 2. These time pulses follow each other and their associated priorities decrease in this order. The end of each can be specified in this message, the beginning is when the circularly previous slot ends (i.e. slot 0 starts when slot 2 finishes). | | | | | |
| Message Structure | | Header | Class | ID | Length (Bytes) | Payload Checksum |
| 0xB5 0x62 | | 0x06 | 0x53 | 16 | see below | CK_A CK_B |

| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| Start of repeated block (N times) | | | | | | |
| N*1 | CH | - | str | - | ASCII Character | |
| End of repeated block | | | | | | |

31.15 UBX-LOG (0x21)

Logging Messages: i.e. Log creation, deletion, info and retrieval.

Messages in the LOG class are used to configure and report status information of the logging and batching features.

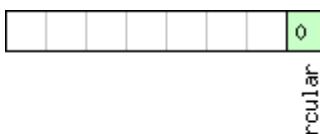

31.15.1 UBX-LOG-CREATE (0x21 0x07)

31.15.1.1 Create Log File

| <i>Message</i> | LOG-CREATE | | | | | |
|--------------------------|---|----------------|-----------------|-----------------------|--|---------------------|
| <i>Description</i> | Create Log File | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| <i>Type</i> | Command | | | | | |
| <i>Comment</i> | <p>This message is used to create an initial logging file and activate the logging subsystem. UBX-ACK-ACK or UBX-ACK-NAK are returned to indicate success or failure.</p> <p>This message does not handle activation of recording or filtering of log entries (see UBX-CFG-LOGFILTER).</p> | | | | | |
| <i>Message Structure</i> | <i>Header</i> | <i>Class</i> | <i>ID</i> | <i>Length (Bytes)</i> | <i>Payload</i> | <i>Checksum</i> |
| | 0xB5 | 0x62 | 0x21 | 0x07 | 8 | see below CK_A CK_B |
| <i>Payload Contents:</i> | | | | | | |
| <i>Byte Offset</i> | <i>Number Format</i> | <i>Scaling</i> | <i>Name</i> | <i>Unit</i> | <i>Description</i> | |
| 0 | U1 | - | version | - | The version of this message. Set to 0 | |
| 1 | X1 | - | logCfg | - | Config flags (see graphic below) | |
| 2 | U1 | - | reserved1 | - | Reserved | |
| 3 | U1 | - | logSize | - | <p>Indicates the size of the log:</p> <p>0 (maximum safe size): Ensures that logging will not be interrupted and enough space will be left available for all other uses of the filestore</p> <p>1 (minimum size):</p> <p>2 (user defined): See 'userDefinedSize' below</p> | |
| 4 | U4 | - | userDefinedSize | bytes | Sets the maximum amount of space in the filestore that can be used by the logging task. This field is only applicable if logSize is set to user defined. | |

Bitfield logCfg

This graphic explains the bits of logCfg

- signed value
- unsigned value
- reserved

| <i>Name</i> | <i>Description</i> |
|-------------|--|
| circular | Log is circular (new entries overwrite old ones in a full log) if this bit set |

31.15.2 UBX-LOG-ERASE (0x21 0x03)

31.15.2.1 Erase Logged Data

| | | | | | | |
|-------------------|--|-------|------|----------------|---------|------------------------|
| Message | LOG-ERASE | | | | | |
| Description | Erase Logged Data | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Command | | | | | |
| Comment | This message deactivates the logging system and erases all logged data. UBX-ACK-ACK or UBX-ACK-NAK are returned to indicate success or failure. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x21 | 0x03 | 0 | see below CK_A CK_B |
| No payload | | | | | | |

31.15.3 UBX-LOG-FINDTIME (0x21 0x0E)

31.15.3.1 Find index of a log entry based on a given time

| Message | LOG-FINDTIME | | | | | |
|-------------------|---|---------|-----------|----------------|---------------------------------------|------------------------|
| Description | Find index of a log entry based on a given time | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Input | | | | | |
| Comment | This message can be used for a time-based search of a log. It can find the index of the first log entry with time equal to the given time, otherwise the index of the most recent entry with time less than the given time. This index can then be used with the UBX-LOG-RETRIEVE message to provide time-based retrieval of log entries. Searching a log is effective for a given time later than the base date (January 1st, 2004). Searching a log for a given time earlier than the base date will result in an 'entry not found' response. (Searching a log for a given time earlier than the base date will result in a UBX-ACK-NAK message in protocol versions less than 18) Searching a log for a given time greater than the last recorded entry's time will return the index of the last recorded entry. (If the logging has stopped due to lack of file space, such a search will result in a UBX-ACK-NAK message in protocol versions less than 18) | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x21 | 0x0E | 12 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | version | - | Message version (=0 for this version) | |
| 1 | U1 | - | type | - | Message type, 0 for request | |
| 2 | U1[2] | - | reserved1 | - | Reserved | |
| 4 | U2 | - | year | - | Year (1-65635) of UTC time | |
| 6 | U1 | - | month | - | Month (1-12) of UTC time | |
| 7 | U1 | - | day | - | Day (1-31) of UTC time | |
| 8 | U1 | - | hour | - | Hour (0-23) of UTC time | |
| 9 | U1 | - | minute | - | Minute (0-59) of UTC time | |
| 10 | U1 | - | second | - | Second (0-60) of UTC time | |

LOG-FINDTIME continued

| Byte Offset | Number Format | Scaling | Name | Unit | Description |
|-------------|---------------|---------|-----------|------|-------------|
| 11 | U1 | - | reserved2 | - | Reserved |

31.15.3.2 Response to FINDTIME request.

| | | | | | | |
|-------------------|--|---------|-------------|----------------|---|-----------|
| Message | LOG-FINDTIME | | | | | |
| Description | Response to FINDTIME request. | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Output | | | | | |
| Comment | - | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 | 0x62 | 0x21 | 0x0E | see below | CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | version | - | Message version (=1 for this version) | |
| 1 | U1 | - | type | - | Message type, 1 for response | |
| 2 | U1[2] | - | reserved1 | - | Reserved | |
| 4 | U4 | - | entryNumber | - | Index of the first log entry with time = given time, otherwise index of the most recent entry with time < given time. If 0xFFFFFFFF, no log entry found with time <= given time. The indexing of log entries is zero based. | |

31.15.4 UBX-LOG-INFO (0x21 0x08)

31.15.4.1 Poll for log information

| | | | | | | |
|-------------------|--|-------|------|----------------|---------|-----------|
| Message | LOG-INFO | | | | | |
| Description | Poll for log information | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Poll Request | | | | | |
| Comment | Upon sending of this message, the receiver returns UBX-LOG-INFO as defined below. | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 | 0x62 | 0x21 | 0x08 | 0 | see below |
| No payload | | | | | | |

31.15.4.2 Log information

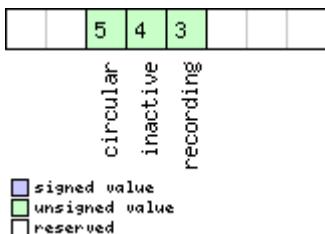

| Message | LOG-INFO | | | | | |
|--------------------------|--|----------------|-------------------|-----------------------|--|------------------|
| Description | Log information | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Output | | | | | |
| Comment | <p>This message is used to report information about the logging subsystem.</p> <p>Note:</p> <ul style="list-style-type: none"> The reported maximum log size will be smaller than that originally specified in LOG-CREATE due to logging and filestore implementation overheads. Log entries are compressed in a variable length fashion, so it may be difficult to predict log space usage with any precision. There may be times when the receiver does not have an accurate time (e.g. if the week number is not yet known), in which case some entries will not have a timestamp. This may result in the oldest/newest entry time values not taking account of these entries. | | | | | |
| Message Structure | <i>Header</i> | <i>Class</i> | <i>ID</i> | <i>Length (Bytes)</i> | | <i>Payload</i> |
| | 0xB5 | 0x62 | 0x21 | 0x08 | 48 | <i>see below</i> |

| 8 | U1 | - | month | - | Month (1-12) of UTC time | |
| 9 | U1 | - | day | - | Day (1-31) of UTC time | |
| 10 | U1 | - | hour | - | Hour (0-23) of UTC time | |
| 11 | U1 | - | minute | - | Minute (0-59) of UTC time | |
| 12 | U1 | - | second | - | Second (0-60) of UTC time | |
| 13 | U1 | - | reserved2 | - | Reserved | |
| 14 | U2 | - | byteCount | - | Size of string in bytes | |
| <i>Start of repeated block (byteCount times)</i> | | | | | | |
| 16 + 1*N | U1 | - | bytes | - | The bytes of the string | |
| <i>End of repeated block</i> | | | | | | |

31.15.8 UBX-LOG-RETRIEVE (0x21 0x09)

31.15.8.1 Request log data

| | | | | | | |
|--------------------|---|--|--|--|--|--|
| <i>Message</i> | LOG-RETRIEVE | | | | | |
| <i>Description</i> | Request log data | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| <i>Type</i> | Command | | | | | |
| <i>Comment</i> | This message is used to request logged data (log recording must first be disabled, see UBX-CFG-LOGFILTER). Log entries are returned in chronological order, using the messages UBX-LOG-RETRIEVEPOS and UBX-LOG-RETRIEVESTRING . If the odometer was enabled at the time a position was logged, then message UBX-LOG-RETRIEVEPOSEXTRA will also be used. The maximum number of entries that can be returned in response to a single UBX-LOG-RETRIEVE message is 256. If more entries than this are required the message will need to be sent multiple times with different startNumbers. The retrieve will be stopped if any UBX-LOG message is received. The speed of transfer can be maximized | | | | | |

| | by using a high data rate and temporarily stopping the GPS processing (see UBX-CFG-RST). | | | | | |
|--------------------------|---|---------|-------------|-----------------------|------|---|
| Message Structure | Header | Class | ID | <i>Length (Bytes)</i> | | <i>Payload</i> <i>Checksum</i> |
| | 0xB5 | 0x62 | 0x21 | 0x09 | 12 | <i>see below</i> CK_A CK_B |
| <i>Payload Contents:</i> | | | | | | |
| Byte Offset | Number Format | Scaling | Name | | Unit | Description |
| 0 | U4 | - | startNumber | | - | Index of first log entry to be transferred. If it is larger than the index of the last available log entry, then the first log entry to be transferred is the last available log entry. The indexing of log entries is zero based. |
| 4 | U4 | - | entryCount | | - | Number of log entries to transfer in total including the first entry to be transferred. If it is larger than the log entries available starting from the first entry to be transferred, then only the available log entries are transferred followed by a UBX-ACK-NAK . The maximum is 256. |
| 8 | U1 | - | version | | - | The version of this message. Set to 0. |
| 9 | U1[3] | - | reserved1 | | - | Reserved |

31.15.9 UBX-LOG-STRING (0x21 0x04)

31.15.9.1 Store arbitrary string in on-board flash

| Message | LOG-STRING | | | | | |
|--|--|---------|-------|-----------------------|---------|--|
| Description | Store arbitrary string in on-board flash | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Command | | | | | |
| Comment | This message can be used to store an arbitrary byte string in the on-board flash memory. The maximum length that can be stored is 256 bytes. | | | | | |
| Message Structure | Header | Class | ID | <i>Length (Bytes)</i> | | <i>Payload</i> <i>Checksum</i> |
| | 0xB5 | 0x62 | 0x21 | 0x04 | 0 + 1*N | <i>see below</i> CK_A CK_B |
| <i>Payload Contents:</i> | | | | | | |
| Byte Offset | Number Format | Scaling | Name | | Unit | Description |
| <i>Start of repeated block (N times)</i> | | | | | | |
| N*1 | U1 | - | bytes | | - | The string of bytes to be logged (maximum 256) |
| <i>End of repeated block</i> | | | | | | |

31.16 UBX-MGA (0x13)

Multiple GNSS Assistance Messages: i.e. Assistance data for various GNSS.

Messages in the MGA class are used for GNSS aiding information from and to the receiver.

31.16.1 UBX-MGA-ACK (0x13 0x60)

31.16.1.1 UBX-MGA-ACK-DATA0

| <i>Message</i> | UBX-MGA-ACK-DATA0 | | | | | |
|--------------------------|--|----------------|-----------------|-----------------------|--|---------------------|
| <i>Description</i> | Multiple GNSS Acknowledge message | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| <i>Type</i> | Output | | | | | |
| <i>Comment</i> | This message is sent by a u-blox receiver to acknowledge the receipt of an assistance message. Acknowledgments are enabled by setting the ackAiding parameter in the UBX-CFG-NAVX5 message. See the description of flow control for details. | | | | | |
| <i>Message Structure</i> | <i>Header</i> | <i>Class</i> | <i>ID</i> | <i>Length (Bytes)</i> | <i>Payload</i> | <i>Checksum</i> |
| | 0xB5 | 0x62 | 0x13 | 0x60 | 8 | see below CK_A CK_B |
| <i>Payload Contents:</i> | | | | | | |
| <i>Byte Offset</i> | <i>Number Format</i> | <i>Scaling</i> | <i>Name</i> | <i>Unit</i> | <i>Description</i> | |
| 0 | U1 | - | type | - | Type of acknowledgment: 0: The message was not used by the receiver (see infoCode field for an indication of why) 1: The message was accepted for use by the receiver (the infoCode field will be 0) | |
| 1 | U1 | - | version | - | Message version (0x00 for this version) | |
| 2 | U1 | - | infoCode | - | Provides greater information on what the receiver chose to do with the message contents: 0: The receiver accepted the data 1: The receiver doesn't know the time so can't use the data (To resolve this a UBX-MGA-INI-TIME_UTC message should be supplied first) 2: The message version is not supported by the receiver 3: The message size does not match the message version 4: The message data could not be stored to the database 5: The receiver is not ready to use the message data 6: The message type is unknown | |
| 3 | U1 | - | msgId | - | UBX message ID of the ack'ed message | |
| 4 | U1[4] | - | msgPayloadStart | - | The first 4 bytes of the ack'ed message's payload | |

31.16.2 UBX-MGA-ANO (0x13 0x20)

31.16.2.1 Multiple GNSS AssistNow Offline Assistance

| Message | MGA-ANO | | | | | |
|-------------------|---|---------|-----------|----------------|---|---------------------|
| Description | Multiple GNSS AssistNow Offline Assistance | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Input | | | | | |
| Comment | This message is created by the AssistNow Offline service to deliver AssistNow Offline assistance to the receiver. See the description of AssistNow Offline for details. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |

31.16.4 UBX-MGA-DBD (0x13 0x80)

31.16.4.1 Poll the Navigation Database

| | | | | | | |
|-------------------|--|-------|------|----------------|---------|---------------------|
| Message | MGA-DBD | | | | | |
| Description | Poll the Navigation Database | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Poll Request | | | | | |
| Comment | Poll the whole navigation data base. The receiver will send all available data from its internal database. The receiver will indicate the finish of the transmission with a UBX-MGA-ACK . The msgPayloadStart field of the UBX-MGA-ACK message will contain a U4 representing the number of UBX-MGA-DBD-DATA* messages sent. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x13 | 0x80 | 0 | see below CK_A CK_B |
| No payload | | | | | | |

31.16.4.2 Navigation Database Dump Entry

| | | | | | | |
|-----------------------------------|--|---------|-----------|----------------|------------------|---------------------|
| Message | MGA-DBD | | | | | |
| Description | Navigation Database Dump Entry | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Input/Output | | | | | |
| Comment | UBX-MGA-DBD messages are only intended to be sent back to the same receiver that generated them. Navigation database entry. The data fields are firmware specific. Transmission of this type of message will be acknowledged by MGA-ACK messages, if acknowledgment has been enabled (see the description of flow control for details). The maximum payload size for firmware 2.01 onwards is 164 bytes (which makes the maximum message size 172 bytes). | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x13 | 0x80 | 12 + 1*N | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1[12] | - | reserved1 | - | Reserved | |
| Start of repeated block (N times) | | | | | | |
| 12 + 1*N | U1 | - | data | - | fw specific data | |
| End of repeated block | | | | | | |

31.16.5 UBX-MGA-FLASH (0x13 0x21)

31.16.5.1 UBX-MGA-FLASH-DATA

| | | | | | | |
|---|--|----------------|-------------|----------------|--|---------------------|
| <i>Message</i> | UBX-MGA-FLASH-DATA | | | | | |
| <i>Description</i> | Transfer MGA-ANO data block to flash | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| <i>Type</i> | Input | | | | | |
| <i>Comment</i> | This message is used to transfer a block of MGA-ANO data from host to the receiver. Upon reception of this message, the receiver will write the payload data to its internal non-volatile memory (flash). Also, on reception of the first MGA-FLASH-DATA message, the receiver will erase the flash allocated to storing any existing MGA-ANO data. The payload can be up to 512 bytes. Payloads larger than this would exceed the receiver's internal buffering capabilities. The receiver will ACK/NACK this message using the message alternatives given below. The host shall wait for an acknowledge message before sending the next data block. See Flash-based AssistNow Offline for details. | | | | | |
| <i>Message Structure</i> | Header | Class | ID | Length (Bytes) | <i>Payload</i> | <i>Checksum</i> |
| | 0xB5 | 0x62 | 0x13 | 0x21 | 6 + 1*size | see below CK_A CK_B |
| <i>Payload Contents:</i> | | | | | | |
| <i>Byte Offset</i> | <i>Number Format</i> | <i>Scaling</i> | <i>Name</i> | <i>Unit</i> | <i>Description</i> | |
| 0 | U1 | - | type | - | Message type (0x01 for this type) | |
| 1 | U1 | - | version | - | Message version (0x00 for this version) | |
| 2 | U2 | - | sequence | - | Message sequence number, starting at 0 and incrementing by 1 for each MGA-FLASH-DATA message sent. | |
| 4 | U2 | - | size | - | Payload size in bytes. | |
| <i>Start of repeated block (size times)</i> | | | | | | |
| 6 + 1*N | U1 | - | data | - | Payload data. | |
| <i>End of repeated block</i> | | | | | | |

31.16.5.2 UBX-MGA-FLASH-STOP

| | | | | | | |
|--------------------------|---|-------|------|----------------|----------------|---------------------|
| <i>Message</i> | UBX-MGA-FLASH-STOP | | | | | |
| <i>Description</i> | Finish flashing MGA-ANO data | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| <i>Type</i> | Input | | | | | |
| <i>Comment</i> | This message is used to tell the receiver that there are no more MGA-FLASH type 1 messages coming, and that it can do any final internal operations needed to commit the data to flash as a background activity. A UBX-MGA-ACK message will be sent at the end of this process. Note that there may be a delay of several seconds before the UBX-MGA-ACK for this message is sent because of the time taken for this processing. See Flash-based AssistNow Offline for details. | | | | | |
| <i>Message Structure</i> | Header | Class | ID | Length (Bytes) | <i>Payload</i> | <i>Checksum</i> |
| | 0xB5 | 0x62 | 0x13 | 0x21 | 2 | see below CK_A CK_B |
| <i>Payload Contents:</i> | | | | | | |

31.16.9 UBX-MGA-INI (0x13 0x40)

31.16.9.1 UBX-MGA-INI-POS_XYZ

| <i>Message</i> | UBX-MGA-INI-POS_XYZ | | | | | |
|--------------------------|--|---------|-----------|----------------|---|---------------------|
| <i>Description</i> | Initial Position Assistance | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| <i>Type</i> | Input | | | | | |
| <i>Comment</i> | Supplying position assistance that is inaccurate by more than the specified position accuracy, may lead to substantially degraded receiver performance. This message allows the delivery of initial position assistance to a receiver in cartesian ECEF coordinates. This message is equivalent to the UBX-MGA-INI-POS_LLH message, except for the coordinate system. See the description of AssistNow Online for details. | | | | | |
| <i>Message Structure</i> | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x13 | 0x40 | 20 | see below CK_A CK_B |
| <i>Payload Contents:</i> | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | type | - | Message type (0x00 for this type) | |
| 1 | U1 | - | version | - | Message version (0x00 for this version) | |
| 2 | U1[2] | - | reserved1 | - | Reserved | |
| 4 | I4 | - | ecefX | cm | WGS84 ECEF X coordinate | |
| 8 | I4 | - | ecefY | cm | WGS84 ECEF Y coordinate | |
| 12 | I4 | - | ecefZ | cm | WGS84 ECEF Z coordinate | |
| 16 | U4 | - | posAcc | cm | Position accuracy (stddev) | |

31.16.9.2 UBX-MGA-INI-POS_LLH

| <i>Message</i> | UBX-MGA-INI-POS_LLH | | | | | |
|--------------------------|--|---------|-----------|----------------|---|---------------------|
| <i>Description</i> | Initial Position Assistance | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| <i>Type</i> | Input | | | | | |
| <i>Comment</i> | Supplying position assistance that is inaccurate by more than the specified position accuracy, may lead to substantially degraded receiver performance. This message allows the delivery of initial position assistance to a receiver in WGS84 lat/long/alt coordinates. This message is equivalent to the UBX-MGA-INI-POS_XYZ message, except for the coordinate system. See the description of AssistNow Online for details. | | | | | |
| <i>Message Structure</i> | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x13 | 0x40 | 20 | see below CK_A CK_B |

31.17 UBX-MON (0x0A)

Monitoring Messages: i.e. Communication Status, CPU Load, Stack Usage, Task Status.

Messages in the MON class are used to report the receiver status, such as CPU load, stack usage, I/O subsystem statistics etc.

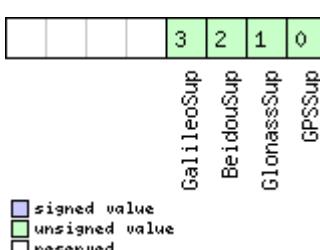

31.17.1 UBX-MON-GNSS (0x0A 0x28)

31.17.1.1 Information message major GNSS selection

| | | | | | | |
|--------------------------|--|----------------|--------------|-----------------------|--|----------------------------|
| <i>Message</i> | MON-GNSS | | | | | |
| <i>Description</i> | Information message major GNSS selection | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| <i>Type</i> | Polled | | | | | |
| <i>Comment</i> | This message reports major GNSS selection. It does this by means of bit masks in U1 fields. Each bit in a bit mask corresponds to one major GNSS. Augmentation systems are not reported. | | | | | |
| | <i>Header</i> | <i>Class</i> | <i>ID</i> | <i>Length (Bytes)</i> | | <i>Payload</i> |
| <i>Message Structure</i> | 0xB5 | 0x62 | 0x0A | 0x28 | 8 | <i>see below</i> CK_A CK_B |
| <i>Payload Contents:</i> | | | | | | |
| <i>Byte Offset</i> | <i>Number Format</i> | <i>Scaling</i> | <i>Name</i> | <i>Unit</i> | <i>Description</i> | |
| 0 | U1 | - | version | - | Message version (0x01 for this version) | |
| 1 | X1 | - | supported | - | A bit mask showing the major GNSS that can be supported by this receiver (see graphic below) | |
| 2 | X1 | - | defaultGnss | - | A bit mask showing the default major GNSS selection. If the default major GNSS selection is currently configured in the efuse for this receiver, it takes precedence over the default major GNSS selection configured in the executing firmware of this receiver. (see graphic below) | |
| 3 | X1 | - | enabled | - | A bit mask showing the current major GNSS selection enabled for this receiver (see graphic below) | |
| 4 | U1 | - | simultaneous | - | Maximum number of concurrent major GNSS that can be supported by this receiver | |
| 5 | U1[3] | - | reserved1 | - | Reserved | |

Bitfield enabled

This graphic explains the bits of enabled

| Name | Description |
|------------|--------------------|
| GPSEna | GPS is enabled |
| GlonassEna | GLONASS is enabled |
| BeidouEna | BeiDou is enabled |
| GalileoEna | Galileo is enabled |

31.17.2 UBX-MON-HW2 (0x0A 0x0B)

31.17.2.1 Extended Hardware Status

| <i>Message</i> | MON-HW2 | | | | | |
|--------------------------|---|----------------|-------------------------|-----------------------|---|----------------------------|
| <i>Description</i> | Extended Hardware Status | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| <i>Type</i> | Periodic/Polled | | | | | |
| <i>Comment</i> | <p>Status of different aspects of the hardware such as Imbalance, Low-Level Configuration and POST Results.</p> <p>The first four parameters of this message represent the complex signal from the RF front end. The following rules of thumb apply:</p> <ul style="list-style-type: none"> • The smaller the absolute value of the variable <code>ofsI</code> and <code>ofsQ</code>, the better. • Ideally, the magnitude of the I-part (<code>magI</code>) and the Q-part (<code>magQ</code>) of the complex signal should be the same. | | | | | |
| <i>Message Structure</i> | <i>Header</i> | <i>Class</i> | <i>ID</i> | <i>Length (Bytes)</i> | | <i>Payload</i> |
| | 0xB5 | 0x62 | 0x0A | 0x0B | 28 | <i>see below</i> CK_A CK_B |
| <i>Payload Contents:</i> | | | | | | |
| <i>Byte Offset</i> | <i>Number Format</i> | <i>Scaling</i> | <i>Name</i> | <i>Unit</i> | <i>Description</i> | |
| 0 | I1 | - | <code>ofsI</code> | - | Imbalance of I-part of complex signal, scaled (-128 = max. negative imbalance, 127 = max. positive imbalance) | |
| 1 | U1 | - | <code>magI</code> | - | Magnitude of I-part of complex signal, scaled (0 = no signal, 255 = max. magnitude) | |
| 2 | I1 | - | <code>ofsQ</code> | - | Imbalance of Q-part of complex signal, scaled (-128 = max. negative imbalance, 127 = max. positive imbalance) | |
| 3 | U1 | - | <code>magQ</code> | - | Magnitude of Q-part of complex signal, scaled (0 = no signal, 255 = max. magnitude) | |
| 4 | U1 | - | <code>cfgSource</code> | - | Source of low-level configuration (114 = ROM, 111 = OTP, 112 = config pins, 102 = flash image) | |
| 5 | U1[3] | - | <code>reserved1</code> | - | Reserved | |
| 8 | U4 | - | <code>lowLevCfg</code> | - | Low-level configuration (obsolete in protocol versions greater than 15) | |
| 12 | U1[8] | - | <code>reserved2</code> | - | Reserved | |
| 20 | U4 | - | <code>postStatus</code> | - | POST status word | |
| 24 | U1[4] | - | <code>reserved3</code> | - | Reserved | |

31.17.3 UBX-MON-HW (0x0A 0x09)

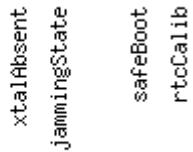

31.17.3.1 Hardware Status

| Message | MON-HW | | | | | |
|--------------------------|---|----------------|-------------|-----------------------|--|-----------------|
| Description | Hardware Status | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Periodic/Polled | | | | | |
| Comment | Status of different aspect of the hardware, such as Antenna, PIO/Peripheral Pins, Noise Level, Automatic Gain Control (AGC) | | | | | |
| | <i>Header</i> | <i>Class</i> | <i>ID</i> | <i>Length (Bytes)</i> | <i>Payload</i> | <i>Checksum</i> |
| Message Structure | 0xB5 | 0x62 | 0x0A | 0x09 | 60 <i>see below</i> | CK_A CK_B |
| <i>Payload Contents:</i> | | | | | | |
| <i>Byte Offset</i> | <i>Number Format</i> | <i>Scaling</i> | <i>Name</i> | <i>Unit</i> | <i>Description</i> | |
| 0 | X4 | - | pinSel | - | Mask of Pins Set as Peripheral/PIO | |
| 4 | X4 | - | pinBank | - | Mask of Pins Set as Bank A/B | |
| 8 | X4 | - | pinDir | - | Mask of Pins Set as Input/Output | |
| 12 | X4 | - | pinVal | - | Mask of Pins Value Low/High | |
| 16 | U2 | - | noisePerMS | - | Noise Level as measured by the GPS Core | |
| 18 | U2 | - | agcCnt | - | AGC Monitor (counts SIGHI xor SIGLO, range 0 to 8191) | |
| 20 | U1 | - | aStatus | - | Status of the Antenna Supervisor State Machine (0=INIT, 1=DONTKNOW, 2=OK, 3=SHORT, 4=OPEN) | |
| 21 | U1 | - | aPower | - | Current PowerStatus of Antenna (0=OFF, 1=ON, 2=DONTKNOW) | |
| 22 | X1 | - | flags | - | Flags (see graphic below) | |
| 23 | U1 | - | reserved1 | - | Reserved | |
| 24 | X4 | - | usedMask | - | Mask of Pins that are used by the Virtual Pin Manager | |
| 28 | U1[17] | - | VP | - | Array of Pin Mappings for each of the 17 Physical Pins | |
| 45 | U1 | - | jamInd | - | CW Jamming indicator, scaled (0 = no CW jamming, 255 = strong CW jamming) | |
| 46 | U1[2] | - | reserved2 | - | Reserved | |
| 48 | X4 | - | pinIrq | - | Mask of Pins Value using the PIO Irq | |
| 52 | X4 | - | pullH | - | Mask of Pins Value using the PIO Pull High Resistor | |
| 56 | X4 | - | pullL | - | Mask of Pins Value using the PIO Pull Low Resistor | |

Bitfield flags

This graphic explains the bits of flags

| | | | | | |
|--|---|---|---|---|---|
| | 4 | 3 | 2 | 1 | 0 |
|--|---|---|---|---|---|

- signed value
- unsigned value
- reserved

| Name | Description |
|--------------|--|
| rtcCalib | RTC is calibrated |
| safeBoot | safeBoot mode (0 = inactive, 1 = active) |
| jammingState | output from Jamming/Interference Monitor (0 = unknown or feature disabled, 1 = ok - no significant jamming, 2 = warning - interference visible but fix OK, 3 = critical - interference visible and no fix) |
| xtalAbsent | RTC xtal has been determined to be absent. (not supported in protocol versions less than 18) |

31.17.4 UBX-MON-IO (0x0A 0x02)

31.17.4.1 I/O Subsystem Status

| Message | | MON-IO | | | | |
|--|---------------|---|-------------|-------|---|----------|
| Description | | I/O Subsystem Status | | | | |
| Firmware | | Supported on: | | | | |
| | | <ul style="list-style-type: none"> • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | |
| Type | | Periodic/Polled | | | | |
| Comment | | The size of the message is determined by the number of ports 'N' the receiver supports, i.e. on u-blox 5 the number of ports is 6. | | | | |
| Message Structure | | Header | Class | ID | Length (Bytes) | Payload |
| | | 0xB5 | 0x62 | 0x0A | 0x02 | 0 + 20*N |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| <i>Start of repeated block (N times)</i> | | | | | | |
| N*20 | U4 | - | rxBytes | bytes | Number of bytes ever received | |
| 4 + 20*N | U4 | - | txBytes | bytes | Number of bytes ever sent | |
| 8 + 20*N | U2 | - | parityErrs | - | Number of 100ms timeslots with parity errors | |
| 10 + 20*N | U2 | - | framingErrs | - | Number of 100ms timeslots with framing errors | |
| 12 + 20*N | U2 | - | overrunErrs | - | Number of 100ms timeslots with overrun errors | |
| 14 + 20*N | U2 | - | breakCond | - | Number of 100ms timeslots with break conditions | |
| 16 + 20*N | U1 | - | rxBusy | - | Flag is receiver is busy | |
| 17 + 20*N | U1 | - | txBusy | - | Flag is transmitter is busy | |
| 18 + 20*N | U1[2] | - | reserved1 | - | Reserved | |
| <i>End of repeated block</i> | | | | | | |

31.17.5 UBX-MON-MSGPP (0x0A 0x06)

31.17.5.1 Message Parse and Process Status

| | | | | | | |
|--------------------------|--|----------------|-------------|-----------------------|---|----------------------------|
| <i>Message</i> | MON-MSGPP | | | | | |
| <i>Description</i> | Message Parse and Process Status | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| <i>Type</i> | Periodic/Polled | | | | | |
| <i>Comment</i> | - | | | | | |
| | <i>Header</i> | <i>Class</i> | <i>ID</i> | <i>Length (Bytes)</i> | <i>Payload</i> | <i>Checksum</i> |
| <i>Message Structure</i> | 0xB5 | 0x62 | 0x0A | 0x06 | 120 | <i>see below</i> CK_A CK_B |
| <i>Payload Contents:</i> | | | | | | |
| <i>Byte Offset</i> | <i>Number Format</i> | <i>Scaling</i> | <i>Name</i> | <i>Unit</i> | <i>Description</i> | |
| 0 | U2[8] | - | msg1 | msgs | Number of successfully parsed messages for each protocol on port0 | |
| 16 | U2[8] | - | msg2 | msgs | Number of successfully parsed messages for each protocol on port1 | |
| 32 | U2[8] | - | msg3 | msgs | Number of successfully parsed messages for each protocol on port2 | |
| 48 | U2[8] | - | msg4 | msgs | Number of successfully parsed messages for each protocol on port3 | |
| 64 | U2[8] | - | msg5 | msgs | Number of successfully parsed messages for each protocol on port4 | |
| 80 | U2[8] | - | msg6 | msgs | Number of successfully parsed messages for each protocol on port5 | |
| 96 | U4[6] | - | skipped | bytes | Number skipped bytes for each port | |

31.17.6 UBX-MON-PATCH (0x0A 0x27)

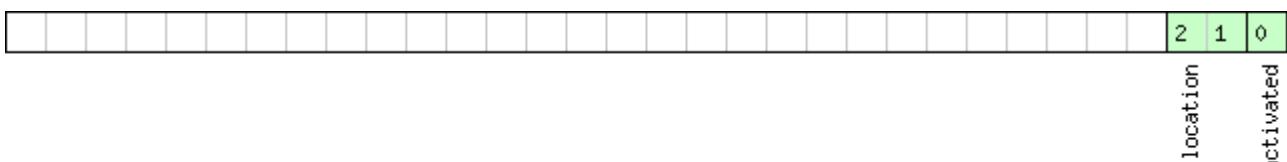

31.17.6.1 Poll Request for installed patches

| | | | | | | |
|--------------------------|--|--------------|-----------|-----------------------|----------------|----------------------------|
| <i>Message</i> | MON-PATCH | | | | | |
| <i>Description</i> | Poll Request for installed patches | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| <i>Type</i> | Poll Request | | | | | |
| <i>Comment</i> | - | | | | | |
| | <i>Header</i> | <i>Class</i> | <i>ID</i> | <i>Length (Bytes)</i> | <i>Payload</i> | <i>Checksum</i> |

| <i>No payload</i> | | | | | | |

31.17.6.2 Output information about installed patches.

Bitfield patchInfo

This graphic explains the bits of `patchInfo`

| Name | Description |
|------------------|--|
| activated | 1: the patch is active. 0: otherwise. |
| location | Indicates where the patch is stored. 0: eFuse, 1: ROM, 2: BBR, 3: file system. |

31.17.7 UBX-MON-RXBUF (0x0A 0x07)

31.17.7.1 Receiver Buffer Status

| | | | | | | |
|-------------------|--|---------|-----------|----------------|---|-----------|
| Message | MON-RXBUF | | | | | |
| Description | Receiver Buffer Status | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Periodic/Polled | | | | | |
| Comment | - | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 0x62 | 0x0A | 0x07 | 24 | see below | CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U2[6] | - | pending | bytes | Number of bytes pending in receiver buffer for each target | |
| 12 | U1[6] | - | usage | % | Maximum usage receiver buffer during the last sysmon period for each target | |
| 18 | U1[6] | - | peakUsage | % | Maximum usage receiver buffer for each target | |

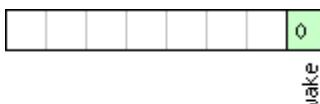

31.17.8 UBX-MON-RXR (0x0A 0x21)

31.17.8.1 Receiver Status Information

| | | | | | | |
|-------------------|--|---------|-------|----------------|--|-----------|
| Message | MON-RXR | | | | | |
| Description | Receiver Status Information | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Output | | | | | |
| Comment | The receiver ready message is sent when the receiver changes from or to backup mode. | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 0x62 | 0x0A | 0x21 | 1 | see below | CK_A CK_B |

| Name | Description |
| awake | not in Backup mode |

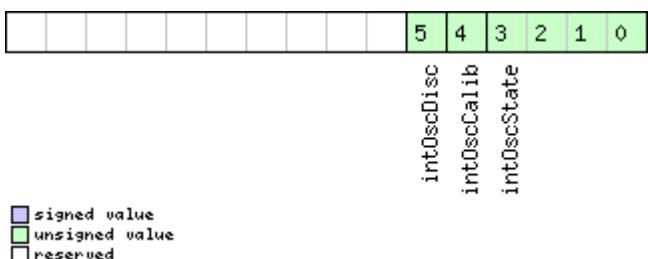

31.17.9 UBX-MON-SMGR (0x0A 0x2E)

31.17.9.1 Synchronization Manager Status

| <i>Message</i> | MON-SMGR | | | | | |
|--------------------------|--|----------------|-------------|-----------------------|--|----------------------------|
| <i>Description</i> | Synchronization Manager Status | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 16 up to version 23.01 (only with Time & Frequency Sync products) | | | | | |
| <i>Type</i> | Periodic/Polled | | | | | |
| <i>Comment</i> | This message reports the status of internal and external oscillators and sources as well as whether GNSS is used for disciplining. | | | | | |
| | <i>Header</i> | <i>Class</i> | <i>ID</i> | <i>Length (Bytes)</i> | | <i>Payload</i> |
| <i>Message Structure</i> | 0xB5 | 0x62 | 0x0A | 0x2E | 16 | <i>see below</i> CK_A CK_B |
| <i>Payload Contents:</i> | | | | | | |
| <i>Byte Offset</i> | <i>Number Format</i> | <i>Scaling</i> | <i>Name</i> | <i>Unit</i> | <i>Description</i> | |
| 0 | U1 | - | version | - | Message version (0 for this version) | |
| 1 | U1[3] | - | reserved1 | - | Reserved | |
| 4 | U4 | - | itOW | ms | Time of the week | |
| 8 | X2 | - | intOsc | - | A bit mask, indicating the status of the local oscillator (see graphic below) | |
| 10 | X2 | - | extOsc | - | A bit mask, indicating the status of the external oscillator (see graphic below) | |
| 12 | U1 | - | discSrc | - | Disciplining source identifier: 0: internal oscillator 1: GNSS 2: EXTINT0 3: EXTINT1 4: internal oscillator measured by the host 5: external oscillator measured by the host | |
| 13 | X1 | - | gnss | - | A bit mask, indicating the status of the GNSS (see graphic below) | |
| 14 | X1 | - | extInt0 | - | A bit mask, indicating the status of the external input 0 (see graphic below) | |
| 15 | X1 | - | extInt1 | - | A bit mask, indicating the status of the external input 1 (see graphic below) | |

Bitfield intOsc

This graphic explains the bits of intOsc

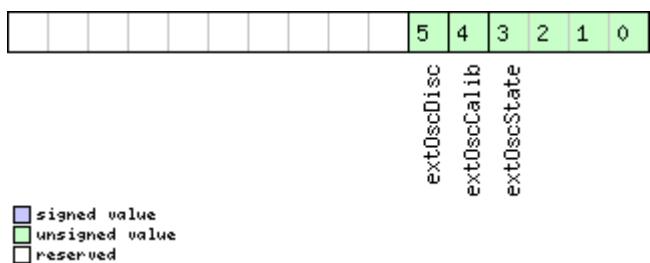

Bitfield intOsc Description continued

| Name | Description |
|-------------|--|
| Name | Description |
| intOscState | State of the oscillator: 0: autonomous operation 1: calibration ongoing 2: oscillator is steered by the host 3: idle state |
| intOscCalib | 1 = oscillator gain is calibrated |
| intOscDisc | 1 = signal is disciplined |

Bitfield extOsc

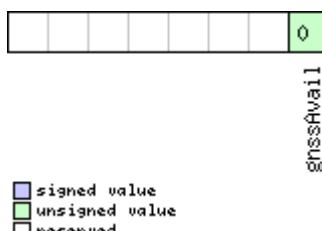

This graphic explains the bits of extOsc

| Name | Description |
|-------------|--|
| extOscState | State of the oscillator: 0: autonomous operation 1: calibration ongoing 2: oscillator is steered by the host 3: idle state |
| extOscCalib | 1 = oscillator gain is calibrated |
| extOscDisc | 1 = signal is disciplined |

Bitfield gnss

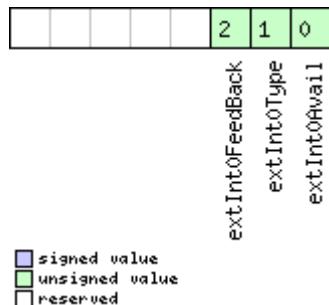

This graphic explains the bits of gnss

| Name | Description |
|-----------|---------------------|
| gnssAvail | 1 = GNSS is present |

Bitfield extInt0

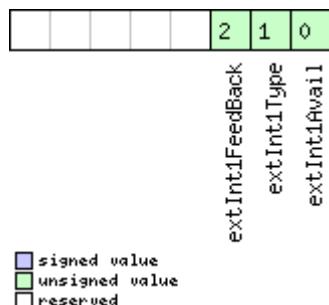

This graphic explains the bits of extInt0

| Name | Description |
|-----------------|--|
| extInt0Avail | 1 = signal present at this input |
| extInt0Type | Source type: 0: frequency 1: time |
| extInt0FeedBack | This source is used as feedback of the external oscillator |

Bitfield extInt1

This graphic explains the bits of extInt1

| Name | Description |
|-----------------|--|
| extInt1Avail | 1 = signal present at this input |
| extInt1Type | Source type: 0: frequency 1: time |
| extInt1FeedBack | This source is used as feedback of the external oscillator |

31.17.10 UBX-MON-TXBUF (0x0A 0x08)

31.17.10.1 Transmitter Buffer Status

| | | | | | | |
|-------------------|--|---------------|------------|----------------------|---|-----------------------|
| Message | MON-TXBUF | | | | | |
| Description | Transmitter Buffer Status | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Periodic/Polled | | | | | |
| Comment | - | | | | | |
| Message Structure | Header 0xB5 0x62 | Class 0x0A | ID 0x08 | Length (Bytes) 28 | Payload <i>see below</i> | Checksum CK_A CK_B |
| Payload Contents: | | | | | | |

31.17.11 UBX-MON-VER (0x0A 0x04)

31.17.11.1 Poll Receiver/Software Version

| | | | | | | |
|-------------------|--|-------|------|----------------|-----------|-----------|
| Message | MON-VER | | | | | |
| Description | Poll Receiver/Software Version | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Poll Request | | | | | |
| Comment | - | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 0x62 | 0x0A | 0x04 | 0 | see below | CK_A CK_B |
| No payload | | | | | | |

31.17.11.2 Receiver/Software Version

| | | | | | | |
|-----------------------------------|--|---------|-----------|----------------|---|-----------|
| Message | MON-VER | | | | | |
| Description | Receiver/Software Version | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Polled | | | | | |
| Comment | - | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 0x62 | 0x0A | 0x04 | 40 + 30*N | see below | CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | CH[30] | - | swVersion | - | Zero-terminated Software Version String. | |
| 30 | CH[10] | - | hwVersion | - | Zero-terminated Hardware Version String | |
| Start of repeated block (N times) | | | | | | |
| 40 + 30*N | CH[30] | - | extension | - | Extended software information strings. A series of zero-terminated strings. Each extension field is 30 characters long and contains varying software information. Not all extension fields may appear. Example reported information can be: the software version string of the underlying ROM (when the receiver's firmware is running from flash), the firmware version, the supported protocol version , the module identifier, the Flash Information Structure (FIS) file information, the supported major GNSS , the supported augmentation systems . | |
| End of repeated block | | | | | | |

31.18 UBX-NAV (0x01)

Navigation Results Messages: i.e. Position, Speed, Time, Acceleration, Heading, DOP, SVs used.

Messages in the NAV class are used to output navigation data such as position, altitude and velocity in a number of formats. Additionally, status flags and accuracy figures are output. The messages are generated with the configured navigation/measurement rate.

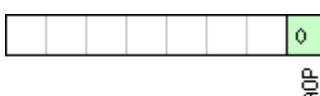

31.18.1 UBX-NAV-AOPSTATUS (0x01 0x60)

31.18.1.1 AssistNow Autonomous Status

| Message | NAV-AOPSTATUS | | | | | |
|-------------------|--|---------|-----------|----------------|---|---------------------|
| Description | AssistNow Autonomous Status | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Periodic/Polled | | | | | |
| Comment | This message provides information on the status of the <i>AssistNow Autonomous</i> subsystem on the receiver. For example, a host application can determine the optimal time to shut down the receiver by monitoring the <code>status</code> field for a steady 0. See the chapter AssistNow Autonomous in the receiver description for details on this feature. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x01 | 0x60 | 16 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U4 | - | iTOW | ms | GPS time of week of the navigation epoch . See the description of iTOW for details. | |
| 4 | U1 | - | aopCfg | - | AssistNow Autonomous configuration (see graphic below) | |
| 5 | U1 | - | status | - | AssistNow Autonomous subsystem is idle (0) or running (not 0) | |
| 6 | U1[10] | - | reserved1 | - | Reserved | |

31.18.4 UBX-NAV-DGPS (0x01 0x31)

31.18.4.1 DGPS Data Used for NAV

| Message | NAV-DGPS | | | | | |
|---------------------------------------|--|---------|------------|----------------|---|-----------|
| Description | DGPS Data Used for NAV | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Periodic/Polled | | | | | |
| Comment | This message outputs the DGPS correction data that has been applied to the current NAV Solution. See also the notes on the RTCM protocol . | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 0x62 | 0x01 | 0x31 | 16 + 12*numCh | see below | CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U4 | - | iTOW | ms | GPS time of week of the navigation epoch . See the description of iTOW for details. | |
| 4 | I4 | - | age | ms | Age of newest correction data | |
| 8 | I2 | - | baseId | - | DGPS base station identifier | |
| 10 | I2 | - | baseHealth | - | DGPS base station health status | |
| 12 | U1 | - | numCh | - | Number of channels for which correction data is following | |
| 13 | U1 | - | status | - | DGPS correction type status: 0x00: none 0x01: PR+PRR correction | |
| 14 | U1[2] | - | reserved1 | - | Reserved | |
| Start of repeated block (numCh times) | | | | | | |
| 16 + 12*N | U1 | - | svid | - | Satellite ID | |
| 17 + 12*N | X1 | - | flags | - | Channel number and usage (see graphic below) | |
| 18 + 12*N | U2 | - | ageC | ms | Age of latest correction data | |
| 20 + 12*N | R4 | - | prc | m | Pseudorange correction | |
| 24 + 12*N | R4 | - | prrc | m/s | Pseudorange rate correction | |
| End of repeated block | | | | | | |

□ reserved

| Name | Description |
|----------|---|
| channel | GPS channel number this SV is on. Channel numbers in the firmware greater than 15 are displayed as having channel number 15 |
| dgpsUsed | 1 = DGPS used for this SV |

31.18.5 UBX-NAV-DOP (0x01 0x04)

31.18.5.1 Dilution of precision

| | | | | | | |
|-------------------|--|---------|------|----------------|--|---------------------|
| Message | NAV-DOP | | | | | |
| Description | Dilution of precision | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Periodic/Polled | | | | | |
| Comment | <ul style="list-style-type: none"> DOP values are dimensionless. All DOP values are scaled by a factor of 100. If the unit transmits a value of e.g. 156, the DOP value is 1.56. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x01 | 0x04 | 18 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U4 | - | iTOW | ms | GPS time of week of the navigation epoch. See the description of iTOW for details. | |
| 4 | U2 | 0.01 | gDOP | - | Geometric DOP | |
| 6 | U2 | 0.01 | pDOP | - | Position DOP | |
| 8 | U2 | 0.01 | tDOP | - | Time DOP | |
| 10 | U2 | 0.01 | vDOP | - | Vertical DOP | |
| 12 | U2 | 0.01 | hDOP | - | Horizontal DOP | |
| 14 | U2 | 0.01 | nDOP | - | Northing DOP | |
| 16 | U2 | 0.01 | eDOP | - | Easting DOP | |

31.18.6 UBX-NAV-EOE (0x01 0x61)

31.18.6.1 End Of Epoch

| | | | | | | |
|-------------------|---|---------|------|----------------|---|---------------------|
| Message | NAV-EOE | | | | | |
| Description | End Of Epoch | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 18 up to version 23.01 | | | | | |
| Type | Periodic | | | | | |
| Comment | This message is intended to be used as a marker to collect all navigation messages of an epoch. It is output after all enabled NAV class messages (except NAV-HNR) and after all enabled NMEA messages. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x01 | 0x61 | 4 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U4 | - | iTOW | ms | GPS time of week of the navigation epoch . See the description of iTOW for details. | |

31.18.7 UBX-NAV-GEOFENCE (0x01 0x39)

31.18.7.1 Geofencing status

| | | | | | | |
|---|--|---------|-----------|----------------|---|---------------------|
| Message | NAV-GEOFENCE | | | | | |
| Description | Geofencing status | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 18 up to version 23.01 | | | | | |
| Type | Periodic/Polled | | | | | |
| Comment | This message outputs the evaluated states of all configured geofences for the current epoch's position. See the Geofencing description for feature details. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x01 | 0x39 | 8 + 2*numFences | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U4 | - | iTOW | ms | GPS time of week of the navigation epoch . See the description of iTOW for details. | |
| 4 | U1 | - | version | - | Message version (0x00 for this version) | |
| 5 | U1 | - | status | - | Geofencing status 0 - Geofencing not available or not reliable 1 - Geofencing active | |
| 6 | U1 | - | numFences | - | Number of geofences | |
| 7 | U1 | - | combState | - | Combined (logical OR) state of all geofences 0 - Unknown 1 - Inside 2 - Outside | |
| Start of repeated block (numFences times) | | | | | | |

NAV-GEOFENCE continued

| Byte Offset | Number Format | Scaling | Name | Unit | Description |

| 16 | I4 | - | ecefZ | cm | ECEF Z coordinate | |
| 20 | I1 | 0.1 | ecefXHp | mm | High precision component of ECEF X coordinate. Must be in the range of -99..+99. Precise coordinate in cm = ecefX + (ecefXHp * 1e-2). | |
| 21 | I1 | 0.1 | ecefYHp | mm | High precision component of ECEF Y coordinate. Must be in the range of -99..+99. Precise coordinate in cm = ecefY + (ecefYHp * 1e-2). | |
| 22 | I1 | 0.1 | ecefZHp | mm | High precision component of ECEF Z coordinate. Must be in the range of -99..+99. Precise coordinate in cm = ecefZ + (ecefZHp * 1e-2). | |
| 23 | U1 | - | reserved2 | - | Reserved | |
| 24 | U4 | 0.1 | pAcc | mm | Position Accuracy Estimate | |

31.18.9 UBX-NAV-HPPOSLLH (0x01 0x14)

31.18.9.1 High Precision Geodetic Position Solution

| Message | NAV-HPPOSLLH | | | | | |
|-------------------|--|---------|-----------|------|--|----------------------------------|
| Description | High Precision Geodetic Position Solution | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 20.01 up to version 23.01 | | | | | |
| Type | Periodic/Polled | | | | | |
| Comment | See important comments concerning validity of position given in section Navigation Output Filters. This message outputs the Geodetic position with high precision in the currently selected ellipsoid. The default is the WGS84 Ellipsoid, but can be changed with the message CFG-DAT . | | | | | |
| | | Header | Class | ID | Length (Bytes) | Payload Checksum |
| Message Structure | | 0xB5 | 0x62 | 0x01 | 0x14 | 36 <i>see below</i> CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | version | - | Message version (0 for this version) | |
| 1 | U1[3] | - | reserved1 | - | Reserved | |
| 4 | U4 | - | iTOW | ms | GPS time of week of the navigation epoch . See the description of iTOW for details. | |
| 8 | I4 | 1e-7 | lon | deg | Longitude | |
| 12 | I4 | 1e-7 | lat | deg | Latitude | |
| 16 | I4 | - | height | mm | Height above ellipsoid. | |
| 20 | I4 | - | hMSL | mm | Height above mean sea level | |
| 24 | I1 | 1e-9 | lonHp | deg | High precision component of longitude. Must be in the range -99..+99. Precise longitude in deg * 1e-7 = lon + (lonHp * 1e-2). | |
| 25 | I1 | 1e-9 | latHp | deg | High precision component of latitude. Must be in the range -99..+99. Precise latitude in deg * 1e-7 = lat + (latHp * 1e-2). | |
| 26 | I1 | 0.1 | heightHp | mm | High precision component of height above ellipsoid. Must be in the range -9..+9. Precise height in mm = height + (heightHp * 0.1). | |
| 27 | I1 | 0.1 | hMSLHp | mm | High precision component of height above mean sea level. Must be in range -9..+9. Precise height in mm = hMSL + (hMSLHp * 0.1) | |
| 28 | U4 | 0.1 | hAcc | mm | Horizontal accuracy estimate | |
| 32 | U4 | 0.1 | vAcc | mm | Vertical accuracy estimate | |

31.18.10 UBX-NAV-ODO (0x01 0x09)

31.18.10.1 Odometer Solution

| Message | NAV-ODO | | | | | |
|-------------------|---|---------|---------------|----------------|---|---------------------|
| Description | Odometer Solution | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Periodic/Polled | | | | | |
| Comment | This message outputs the traveled distance since last reset (see NAV-RESETODO) together with an associated estimated accuracy and the total cumulated ground distance (can only be reset by a cold start of the receiver). | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x01 | 0x09 | 20 | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | version | - | Message version (0 for this version) | |
| 1 | U1[3] | - | reserved1 | - | Reserved | |
| 4 | U4 | - | iTOW | ms | GPS time of week of the navigation epoch . See the description of iTOW for details. | |
| 8 | U4 | - | distance | m | Ground distance since last reset | |
| 12 | U4 | - | totalDistance | m | Total cumulative ground distance | |
| 16 | U4 | - | distanceStd | m | Ground distance accuracy (1-sigma) | |

31.18.11 UBX-NAV-ORB (0x01 0x34)

31.18.11.1 GNSS Orbit Database Info

| Message | NAV-ORB | | | | | |
|---------------------------------------|--|---------|-----------|----------------|---|---------------------|
| Description | GNSS Orbit Database Info | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Periodic/Polled | | | | | |
| Comment | Status of the GNSS orbit database knowledge. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |

31.18.15 UBX-NAV-RELPOSNED (0x01 0x3C)

31.18.15.1 Relative Positioning Information in NED frame

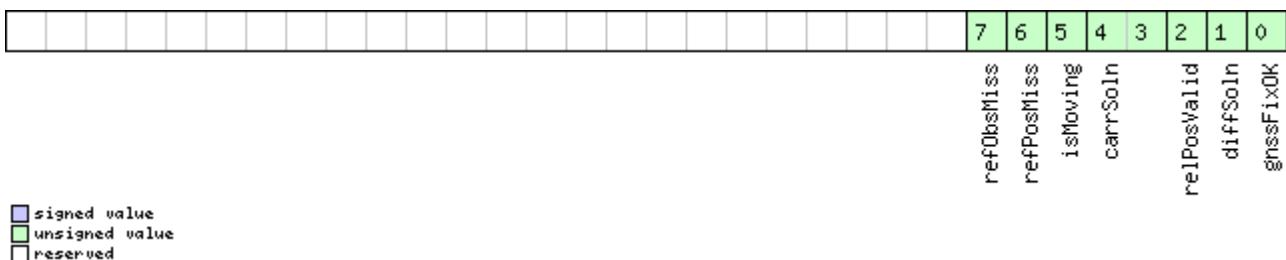

| | | | | | | |
|-------------------|---|---------|--------------|----------------|--|-----------|
| Message | NAV-RELPOSNED | | | | | |
| Description | Relative Positioning Information in NED frame | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 20 up to version 23.01 (only with High Precision GNSS products) | | | | | |
| Type | Periodic/Polled | | | | | |
| Comment | The NED frame is defined as the local topological system at the reference station. The relative position vector components in this message, along with their associated accuracies, are given in that local topological system This message contains the relative position vector from the Reference Station to the Rover, including accuracy figures, in the local topological system defined at the reference station | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 0x62 | 0x01 | 0x3C | 40 | see below | CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | version | - | Message version (0x00 for this version) | |
| 1 | U1 | - | reserved1 | - | Reserved | |
| 2 | U2 | - | refStationId | - | Reference Station ID. Must be in the range 0..4095 | |
| 4 | U4 | - | iTOW | ms | GPS time of week of the navigation epoch . See the description of iTOW for details. | |
| 8 | I4 | - | relPosN | cm | North component of relative position vector | |
| 12 | I4 | - | relPosE | cm | East component of relative position vector | |
| 16 | I4 | - | relPosD | cm | Down component of relative position vector | |
| 20 | I1 | 0.1 | relPosHPN | mm | High-precision North component of relative position vector. Must be in the range -99 to +99. The full North component of the relative position vector, in units of cm, is given by relPosN + (relPosHPN * 1e-2) | |
| 21 | I1 | 0.1 | relPosHPE | mm | High-precision East component of relative position vector. Must be in the range -99 to +99. The full East component of the relative position vector, in units of cm, is given by relPosE + (relPosHPE * 1e-2) | |

NAV-RELPOSNED continued

| Byte Offset | Number Format | Scaling | Name | Unit | Description |
|-------------|---------------|---------|-----------|------|---|
| 22 | I1 | 0.1 | relPosHPD | mm | High-precision Down component of relative position vector. Must be in the range -99 to +99. The full Down component of the relative position vector, in units of cm, is given by relPosD + (relPosHPD * 1e-2) |
| 23 | U1 | - | reserved2 | - | Reserved |
| 24 | U4 | 0.1 | accN | mm | Accuracy of relative position North component |
| 28 | U4 | 0.1 | accE | mm | Accuracy of relative position East component |
| 32 | U4 | 0.1 | accD | mm | Accuracy of relative position Down component |
| 36 | X4 | - | flags | - | Flags (see graphic below) |

Bitfield flags

This graphic explains the bits of `flags`

| Name | Description |
|-------------|--|
| gnssFixOK | A valid fix (i.e. within DOP & accuracy masks) |
| diffSoln | 1 if differential corrections were applied |
| relPosValid | 1 if relative position components and accuracies are valid |
| carrSoln | Carrier phase range solution status: 0 = No carrier phase range solution 1 = Float solution. No fixed integer carrier phase measurements have been used to calculate the solution 2 = Fixed solution. One or more fixed integer carrier phase range measurements have been used to calculate the solution |
| isMoving | 1 if the receiver is operating in moving baseline mode (not supported in protocol versions less than 20.3) |
| refPosMiss | 1 if extrapolated reference position was used to compute moving baseline solution this epoch (not supported in protocol versions less than 20.3) |
| refObsMiss | 1 if extrapolated reference observations were used to compute moving baseline solution this epoch (not supported in protocol versions less than 20.3) |

31.18.16 UBX-NAV-RESETODO (0x01 0x10)

31.18.16.1 Reset odometer

| | | | | | | |
|-------------------|--|-------|------|----------------|---------|---------------------|
| Message | NAV-RESETODO | | | | | |
| Description | Reset odometer | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Command | | | | | |
| Comment | This message resets the traveled distance computed by the odometer (see UBX-NAV-ODO). UBX-ACK-ACK or UBX-ACK-NAK are returned to indicate success or failure. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x01 | 0x10 | 0 | see below CK_A CK_B |
| No payload | | | | | | |

31.18.17 UBX-NAV-SAT (0x01 0x35)

31.18.17.1 Satellite Information

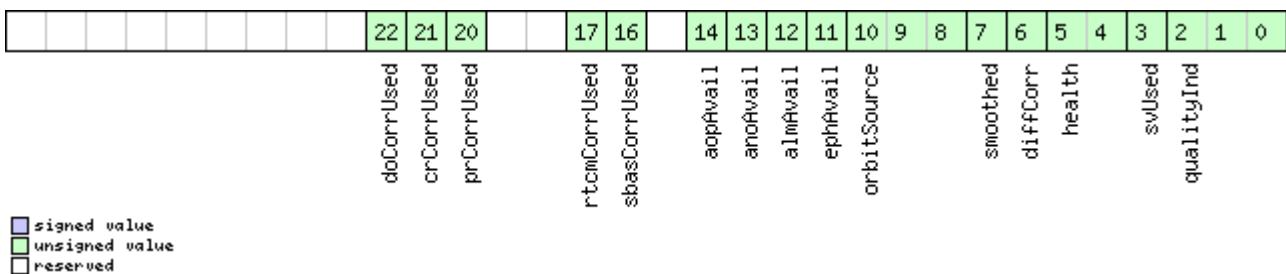

| | | | | | | |
|--|--|---------|-----------|----------------|---|---------------------|
| Message | NAV-SAT | | | | | |
| Description | Satellite Information | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| Type | Periodic/Polled | | | | | |
| Comment | This message displays information about SVs which are either known to be visible or currently tracked by the receiver. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x01 | 0x35 | 8 + 12*numSvs | see below CK_A CK_B |

31.19 UBX-RXM (0x02)

Receiver Manager Messages: i.e. Satellite Status, RTC Status.

Messages in the RXM class are used to output status and result data from the Receiver Manager. The output rate is not bound to the navigation/measurement rate and messages can also be generated on events.

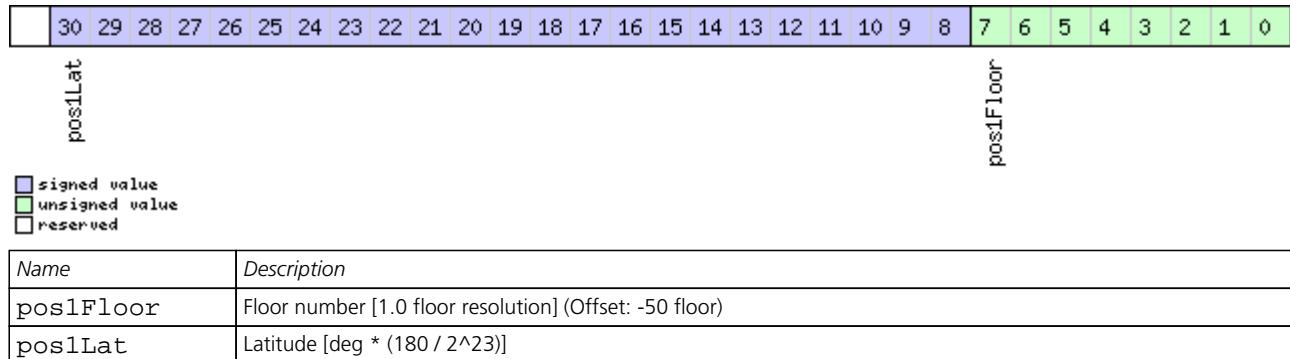

31.19.1 UBX-RXM-IMES (0x02 0x61)

31.19.1.1 Indoor Messaging System Information

| Message | RXM-IMES | | | | | |
|---------------------------------------|---|-------------|--------------|----------------|---|-----------|
| Description | Indoor Messaging System Information | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 18 up to version 23.01 | | | | | |
| Type | Periodic/Polled | | | | | |
| Comment | <p>This message shows the IMES stations the receiver is currently tracking, their data rate, the signal level, the Doppler (with respect to 1575.4282MHz) and what data (without protocol specific overhead) it has received from these stations so far.</p> <p>This message is sent out at the navigation rate the receiver is currently set to. Therefore it allows users to get an overview on the receiver's current state from the IMES perspective.</p> | | | | | |

31.19.2 UBX-RXM-MEASX (0x02 0x14)

31.19.2.1 Satellite Measurements for RRLP

| | |
|--------------------|--|
| Message | RXM-MEASX |
| Description | Satellite Measurements for RRLP |
| Firmware | Supported on: <ul style="list-style-type: none">• u-blox 8 / u-blox M8 from protocol version 18 up to version 23.01 |
| Type | Periodic |
| Comment | The message payload data is, where possible and appropriate, according to the Radio Resource LCS (Location Services) Protocol (RRLP) [1]. One exception is the satellite and GNSS ids, which here are given according to the Satellite Numbering scheme. The correct satellites have to be selected and their satellite ID translated accordingly [1, tab. A.10.14] for use in a RRLP Measure Position Response Component. Similarly, the measurement reference time of week has to be forwarded correctly (modulo 14400000 for the 24 LSB GPS measurements variant, modulo 3600000 for the 22 LSB Galileo and Additional Navigation Satellite Systems (GNSS) measurements variant) of the RRLP measure position |

Bitfield flags

This graphic explains the bits of flags

backup

- signed value
- unsigned value
- reserved

| Name | Description |
|--------|--|
| backup | The receiver goes into backup mode for a time period defined by duration. Provided that it is not connected to USB |

31.19.3.2 Requests a Power Management task

| | | | | | | |
|-------------------|--|-------|------|----------------|---------|---------------------|
| Message | RXM-PMREQ | | | | | |
| Description | Requests a Power Management task | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 18 up to version 23.01 | | | | | |
| Type | Command | | | | | |
| Comment | Request of a Power Management related task of the receiver. | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x02 | 0x41 | 16 | see below CK_A CK_B |

Payload Contents:

| Byte Offset | Number Format | Scaling | Name | Unit | Description |
|-------------|---------------|---------|---------------|------|---|
| 0 | U1 | - | version | - | Message version (0x00 for this version) |
| 1 | U1[3] | - | reserved1 | - | Reserved |
| 4 | U4 | - | duration | ms | Duration of the requested task, set to zero for infinite duration. The maximum supported time is 12 days. |
| 8 | X4 | - | flags | - | task flags (see graphic below) |
| 12 | X4 | - | wakeupSources | - | Configure pins to wakeup the receiver. The receiver wakes up if there is either a falling or a rising edge on one of the configured pins (see graphic below) |

Bitfield flags

This graphic explains the bits of flags

bit 15 reserved

bit 14 backup

bit 13 force

bits 12-0 flags

| | | |
|--------------|--|----------|
| signed value | unsigned value | reserved |
| Name | Description | |
| backup | The receiver goes into backup mode for a time period defined by duration. Provided that it is not connected to USB | |
| force | Force receiver backup while USB is connected. USB interface will be disabled. | |

Bitfield wakeupSources

This graphic explains the bits of wakeupSources

bits 15-13 reserved

bits 12-10 spics

bits 9-8 extint1/extint0

bit 7 reserved

bit 6 uartrx

bit 5 reserved

| | | |
|--------------|---|----------|
| signed value | unsigned value | reserved |
| Name | Description | |
| uartrx | Wakeup the receiver if there is an edge on the UART RX pin. | |

Bitfield wakeupSources Description continued

| Name | Description |
|---------|---|
| extint0 | Wakeup the receiver if there is an edge on the EXTINT0 pin. |
| extint1 | Wakeup the receiver if there is an edge on the EXTINT1 pin. |
| spics | Wakeup the receiver if there is an edge on the SPI CS pin. |

31.19.4 UBX-RXM-RAWX (0x02 0x15)

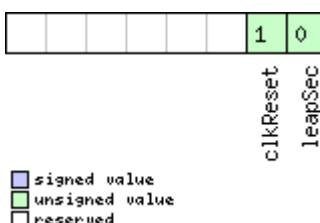

31.19.4.1 Multi-GNSS Raw Measurement Data

| | | | | | | |
|---|---|---------|-----------|----------------|---|---------------------|
| Message | RXM-RAWX | | | | | |
| Description | Multi-GNSS Raw Measurement Data | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 with protocol version 17 (only with Time Sync products) | | | | | |
| Type | Periodic/Polled | | | | | |
| Comment | <p>This message contains the information needed to be able to generate a RINEX 3 multi-GNSS observation file.</p> <p>This message contains pseudorange, Doppler, carrier phase, phase lock and signal quality information for GNSS satellites once signals have been synchronized. This message supports all active GNSS.</p> | | | | | |
| Message Structure | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| | 0xB5 | 0x62 | 0x02 | 0x15 | 16 + 32*numMeas | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | R8 | - | rcvTow | s | Measurement time of week in receiver local time approximately aligned to the GPS time system. The receiver local time of week, week number and leap second information can be used to translate the time to other time systems. More information about the difference in time systems can be found in RINEX 3 documentation. For a receiver operating in GLONASS only mode, UTC time can be determined by subtracting the leapS field from GPS time regardless of whether the GPS leap seconds are valid. | |
| 8 | U2 | - | week | weeks | GPS week number in receiver local time . | |
| 10 | I1 | - | leapS | s | GPS leap seconds (GPS-UTC). This field represents the receiver's best knowledge of the leap seconds offset. A flag is given in the recStat bitfield to indicate if the leap seconds are known. | |
| 11 | U1 | - | numMeas | - | Number of measurements to follow | |
| 12 | X1 | - | recStat | - | Receiver tracking status bitfield (see graphic below) | |
| 13 | U1[3] | - | reserved1 | - | Reserved | |
| Start of repeated block (numMeas times) | | | | | | |

RXM-RAWX continued

| Byte Offset | Number Format | Scaling | Name | Unit | Description |
|------------------------------|---------------|---------------|-----------|--------|---|
| 16 + 32*N | R8 | - | prMes | m | Pseudorange measurement [m]. GLONASS inter frequency channel delays are compensated with an internal calibration table. |
| 24 + 32*N | R8 | - | cpMes | cycles | Carrier phase measurement [cycles]. The carrier phase initial ambiguity is initialized using an approximate value to make the magnitude of the phase close to the pseudorange measurement. Clock resets are applied to both phase and code measurements in accordance with the RINEX specification. |
| 32 + 32*N | R4 | - | doMes | Hz | Doppler measurement (positive sign for approaching satellites) [Hz] |
| 36 + 32*N | U1 | - | gnssId | - | GNSS identifier (see Satellite Numbering for a list of identifiers) |
| 37 + 32*N | U1 | - | svId | - | Satellite identifier (see Satellite Numbering) |
| 38 + 32*N | U1 | - | reserved2 | - | Reserved |
| 39 + 32*N | U1 | - | freqId | - | Only used for GLONASS: This is the frequency slot + 7 (range from 0 to 13) |
| 40 + 32*N | U2 | - | locktime | ms | Carrier phase locktime counter (maximum 64500ms) |
| 42 + 32*N | U1 | - | cno | dBHz | Carrier-to-noise density ratio (signal strength) [dB-Hz] |
| 43 + 32*N | X1 | 0. 01*2^n | prStdev | m | Estimated pseudorange measurement standard deviation (see graphic below) |
| 44 + 32*N | X1 | 0.004 | cpStdev | cycles | Estimated carrier phase measurement standard deviation (note a raw value of 0x0F indicates the value is invalid) (see graphic below) |
| 45 + 32*N | X1 | 0. 002*2^n | doStdev | Hz | Estimated Doppler measurement standard deviation. (see graphic below) |
| 46 + 32*N | X1 | - | trkStat | - | Tracking status bitfield (see graphic below) |
| 47 + 32*N | U1 | - | reserved3 | - | Reserved |
| <i>End of repeated block</i> | | | | | |

Bitfield recStat

This graphic explains the bits of `recStat`

Bitfield recStat Description continued

| Name | Description |
|----------|---|
| leapSec | Leap seconds have been determined |
| clkReset | Clock reset applied. Typically the receiver clock is changed in increments of integer milliseconds. |

Bitfield prStdev

This graphic explains the bits of prStdev

prStd

- signed value

| 2 | U1[2] | - | reserved1 | - | Reserved | |
| 4 | U2 | - | refStation | - | Reference station ID | |
| 6 | U2 | - | msgType | - | Message type | |

Bitfield flags

This graphic explains the bits of flags

| Name | Description |
|-----------|---|
| crcFailed | 0 when RTCM message received and passed CRC check, 1 when failed in which case refStation and msgType might be corrupted and misleading |

31.19.7 UBX-RXM-SFRBX (0x02 0x13)

31.19.7.1 Broadcast Navigation Data Subframe

| | | | | | | |
|--|--|---------|-----------|----------------|--|---------------------|
| Message | RXM-SFRBX | | | | | |
| Description | Broadcast Navigation Data Subframe | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 with protocol version 17 (only with Time Sync products) | | | | | |
| Type | Output | | | | | |
| Comment | This message reports a complete subframe of broadcast navigation data decoded from a single signal. The number of data words reported in each message depends on the nature of the signal. See the section on Broadcast Navigation Data for further details. | | | | | |
| | Header | Class | ID | Length (Bytes) | Payload | Checksum |
| Message Structure | 0xB5 | 0x62 | 0x02 | 0x13 | 8 + 4*numWords | see below CK_A CK_B |
| Payload Contents: | | | | | | |
| Byte Offset | Number Format | Scaling | Name | Unit | Description | |
| 0 | U1 | - | gnssId | - | GNSS identifier (see Satellite Numbering) | |
| 1 | U1 | - | svId | - | Satellite identifier (see Satellite Numbering) | |
| 2 | U1 | - | reserved1 | - | Reserved | |
| 3 | U1 | - | freqId | - | Only used for GLONASS: This is the frequency slot + 7 (range from 0 to 13) | |
| 4 | U1 | - | numWords | - | The number of data words contained in this message (0..16) | |
| 5 | U1 | - | reserved2 | - | Reserved | |
| 6 | U1 | - | version | - | Message version (0x01 for this version) | |
| 7 | U1 | - | reserved3 | - | Reserved | |
| Start of repeated block (numWords times) | | | | | | |
| 8 + 4*N | U4 | - | dwrd | - | The data words | |
| End of repeated block | | | | | | |

31.19.7.2 Broadcast Navigation Data Subframe

| <i>Message</i> | RXM-SFRBX | | | | | |
|---|--|----------------|-------------|-----------------------|--|-----------------|
| <i>Description</i> | Broadcast Navigation Data Subframe | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 18 up to version 23.01 | | | | | |
| <i>Type</i> | Output | | | | | |
| <i>Comment</i> | This message reports a complete subframe of broadcast navigation data decoded from a single signal. The number of data words reported in each message depends on the nature of the signal. See the section on Broadcast Navigation Data for further details. | | | | | |

31.21 UBX-TIM (0x0D)

Timing Messages: i.e. Time Pulse Output, Time Mark Results.

Messages in the TIM class are used to output timing information from the receiver, like Time Pulse and Time Mark measurements.

31.21.1 UBX-TIM-DOSC (0x0D 0x11)

31.21.1.1 Disciplined oscillator control

| | | | | | | |
|--------------------------|---|----------------|-------------|-----------------------|--|----------------------------|
| <i>Message</i> | TIM-DOSC | | | | | |
| <i>Description</i> | Disciplined oscillator control | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 16 up to version 23.01 (only with Time & Frequency Sync products) | | | | | |
| <i>Type</i> | Output | | | | | |
| <i>Comment</i> | The receiver sends this message when it is disciplining an external oscillator and the external oscillator is set up to be controlled via the host. | | | | | |
| | <i>Header</i> | <i>Class</i> | <i>ID</i> | <i>Length (Bytes)</i> | | <i>Payload</i> |
| <i>Message Structure</i> | 0xB5 | 0x62 | 0x0D | 0x11 | 8 | <i>see below</i> CK_A CK_B |

| 20 | I4 | 2^-8 | extDeltaFreq | ppb | Frequency increment of the external oscillator |
| 24 | U4 | 2^-8 | extDeltaFreqUnc | ppb | Uncertainty of the external oscillator frequency increment |
| 28 | U4 | - | extRaw | - | Current raw DAC setting commanded to the external oscillator |

31.21.3 UBX-TIM-HOC (0x0D 0x17)

31.21.3.1 Host oscillator control

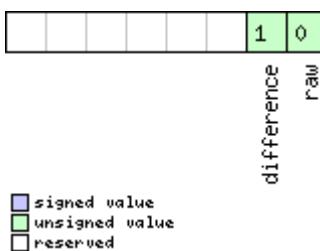

| | | | | | | |
|-------------------|---|---------|---------|----------------|--------------------------------------|---------------------|
| Message | TIM-HOC | | | | | |
| Description | Host oscillator control | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 16 up to version 23.01 (only with Time & Frequency Sync products) | | | | | |
| Type | Input | | | | | |
| Comment | <p>This message can be sent by the host to force the receiver to bypass the disciplining algorithms in the SMGR and carry out the instructed changes to internal or external oscillator frequency. No checks are carried out on the size of the frequency change requested, so normal limits imposed by the SMGR are ignored.</p> <p>It is recommended that the disciplining of that oscillator is disabled before this message is sent (i.e. by clearing the enableInternal or enableExternal flag in the CFG-SMGR message), otherwise the autonomous disciplining processes may cancel the effect of the direct command.</p> <p>Note that the GNSS subsystem may temporarily lose track of some/all satellite signals if a large change of the internal oscillator is made.</p> | | | | | |

31.21.4 UBX-TIM-SMEAS (0x0D 0x13)

31.21.4.1 Source measurement

| | | | | | |
|-------------------|--|-------|------|-----------------|---------------------|
| Message | TIM-SMEAS | | | | |
| Description | Source measurement | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 16 up to version 23.01 (only with Time & Frequency Sync products) | | | | |
| Type | Input/Output | | | | |
| Comment | Frequency and/or phase measurement of synchronization sources. The measurements are relative to the nominal frequency and nominal phase. The receiver reports the measurements on its sync sources using this message. Which measurements are reported can be configured using UBX-CFG-SMGR. The host may report offset of the receiver's outputs with this message as well. The receiver has to be configured using UBX-CFG-SMGR to enable the use of the external measurement messages. Otherwise the receiver will ignore them. | | | | |

| <i>Start of repeated block (numMeas times)</i> | | | | | |
| 12 + 24*N | U1 | - | sourceId | - | Index of source. SMEAS can provide six measurement sources. The first four sourceld values represent measurements made by the receiver and sent to the host. The first of these with a sourceld value of 0 is a measurement of the internal oscillator against the current receiver time-and-frequency estimate. The internal oscillator is being disciplined against that estimate and this result represents the current offset between the actual and desired internal oscillator states. The next three sourceld values represent frequency and time measurements made by the receiver against the internal oscillator. sourceld 1 represents the GNSS-derived frequency and time compared with the internal oscillator frequency and time. sourceld2 give measurements of a signal coming in on EXTINT0. sourceld 3 corresponds to a similar measurement on EXTINT1. The remaining two of these measurements (sourceld 4 and 5) are made by the host and sent to the receiver. A measurement with sourceld 4 is a measurement by the host of the internal oscillator and sourceld 5 indicates a host measurement of the external oscillator. |

31.21.9.2 VCO calibration extended command

| | | | | | | |
|-------------|---|--|--|--|--|--|
| Message | TIM-VCOCAL | | | | | |
| Description | VCO calibration extended command | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 16 up to version 23.01 (only with Time & Frequency Sync products) | | | | | |
| Type | Command | | | | | |
| Comment | <p>Calibrate (measure) gain of the voltage controlled oscillator. The calibration is performed by varying the raw oscillator control values between the limits specified in raw0 and raw1. maxStepSize is the largest step change that can be used during the calibration process. The "raw values" are either PWM duty cycle values or DAC values depending on how the VCTCXO is connected to the system. The measured gain is the transfer function dRelativeFrequencyChange/dRaw (not dFrequency/dVoltage). The calibration process works as follows:</p> <p>Starting from the current raw output the control value is changed in the direction of raw0 in steps of size at most maxStepSize. Then the frequency is measured and the control value is changed towards raw1, again in steps of maxStepSize. When raw1 is reached, the frequency is again measured and the message version DATA0 is output containing the measured result. Normal operation then resumes. If the control value movement is less than maxStepSize then the transition will happen in one step - this will give fast calibration.</p> <p>Care must be taken when calibrating the internal oscillator against the GNSS source. In that case the changes applied to the oscillator frequency could be severe enough to lose satellite signal tracking, especially when signals are weak. If too many signals are lost, the GNSS system will lose its fix and be unable to measure the oscillator frequency - the calibration will then fail. In this case maxStepSize must be reasonably small.</p> <p>It is also important that only the chosen frequency source is enabled during the calibration process and that it remains stable throughout the calibration period; otherwise incorrect oscillator measurements will be made and this will lead to miscalibration and poor subsequent operation of the receiver.</p> | | | | | |

31.21.9.3 Results of the calibration

| Message | TIM-VCOCAL | | | | | | |
|--------------------------|--|---------|---------|----------------|---------|---|-----------|
| Description | Results of the calibration | | | | | | |
| Firmware | Supported on: • u-blox 8 / u-blox M8 from protocol version 16 up to version 23.01 (only with Time & Frequency Sync products) | | | | | | |
| Type | Periodic/Polled | | | | | | |
| Comment | This message is sent when the oscillator gain calibration process is finished (successful or unsuccessful). It notifies the user of the calibrated oscillator gain. If the oscillator gain calibration process was successful, this message will contain the measured gain (field gainVco) and its uncertainty (field gainUncertainty). The calibration process can however fail. In that case the two fields gainVco and gainUncertainty are set to zero. | | | | | | |

31.22 UBX-UPD (0x09)

Firmware Update Messages: i.e. Memory/Flash erase/write, Reboot, Flash identification, etc..

Messages in the UPD class are used to update the firmware and identify any attached flash device.

31.22.1 UBX-UPD-SOS (0x09 0x14)

31.22.1.1 Poll Backup File Restore Status

| | | | | | | |
|--------------------------|--|--------------|-----------|-----------------------|----------------|---------------------|
| <i>Message</i> | UPD-SOS | | | | | |
| <i>Description</i> | Poll Backup File Restore Status | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| <i>Type</i> | Poll Request | | | | | |
| <i>Comment</i> | Sending this (empty / no-payload) message to the receiver results in the receiver returning a <i>System Restored from Backup</i> message as defined below. | | | | | |
| <i>Message Structure</i> | <i>Header</i> | <i>Class</i> | <i>ID</i> | <i>Length (Bytes)</i> | <i>Payload</i> | <i>Checksum</i> |
| | 0xB5 | 0x62 | 0x09 | 0x14 | 0 | see below CK_A CK_B |

31.22.1.2 Create Backup File in Flash

| | | | | | | |
|--------------------------|---|----------------|-------------|-----------------------|---------------------|---------------------|
| <i>Message</i> | UPD-SOS | | | | | |
| <i>Description</i> | Create Backup File in Flash | | | | | |
| <i>Firmware</i> | Supported on: • u-blox 8 / u-blox M8 from protocol version 15 up to version 23.01 | | | | | |
| <i>Type</i> | Command | | | | | |
| <i>Comment</i> | The host can send this message in order to save part of the BBR memory in a file in flash file system. The feature is designed in order to emulate the presence of the backup battery even if it is not present; the host can issue the save on shutdown command before switching off the device supply. It is recommended to issue a GNSS stop command before, in order to keep the BBR memory content consistent. | | | | | |
| <i>Message Structure</i> | <i>Header</i> | <i>Class</i> | <i>ID</i> | <i>Length (Bytes)</i> | <i>Payload</i> | <i>Checksum</i> |

| 5 | U1[3] | - | reserved2 | - | Reserved | |

32 RTCM Protocol

The RTCM (Radio Technical Commission for Maritime Services) protocol is a unidirectional protocol (input to the receiver) that is used to supply the GNSS receiver with real-time differential correction data. The RTCM protocol specification is available from <http://www.rtcm.org>.

32.1 RTCM2

32.1.1 Introduction

This feature is only applicable to GPS operation.

This feature only supports code differential positioning.

For effective differential positioning accuracy, it is necessary that the reference station antenna is situated in a low multipath environment with an unobstructed view of the sky. It is recommended that reference receiver applies phase smoothing to the broadcast corrections.

This feature is not available with the High Precision GNSS products.

32.1.2 Supported Messages

The following RTCM 2.3 messages are supported:

Supported RTCM 2.3 Message Types

| Message Type | Description |
|--------------|------------------------------------|
| 1 | Differential GPS Corrections |
| 2 | Delta Differential GPS Corrections |
| 3 | GPS Reference Station Parameters |
| 9 | GPS Partial Correction Set |

32.1.3 Configuration

The DGPS feature does not need any configuration to work properly. When an RTCM stream is input on any of the communication interfaces, the data will be parsed and applied if possible, which will put the receiver into DGPS mode.

The only configurable parameter of DGPS mode is the timeout that can be specified using [UBX-CFG-NAV5](#). This value defines the time after which old RTCM data will be discarded.

The RTCM protocol can be disabled/enabled on communication interfaces by means of the [UBX-CFG-PRT](#) message. By default, RTCM is enabled.

32.1.4 Output

DGPS mode will result in following modified output:

- [NMEA-GGA](#): The quality field will be 2 (see [NMEA Positon Fix Flags](#)). The age of DGPS corrections and Reference station ID will be set.
- [NMEA-GLL](#), [NMEA-RMC](#), [NMEA-VTG](#), [NMEA-GNS](#): The posMode indicator will be D (see [NMEA Positon Fix Flags](#)).
- [NMEA-PUBX-POSITION](#): The status will be D2/D3; The age of DGPS corrections will be set.

- [UBX-NAV-SOL](#): The DGPS flag will be set.
- [UBX-NAV-PVT](#): The diffSoln flag will be set.
- [UBX-NAV-STATUS](#): The diffSoln flag will be set; the diffCorr flag will be set.
- [UBX-NAV-SVINFO](#): The DGPS flag will be set for channels with valid DGPS correction data.
- [UBX-NAV-DGPS](#): This message will contain all valid DGPS data
- If the base line exceeds 100km and a message type 3 is received, a [UBX-INF-WARNING](#) will be output, e.g. "WARNING: DGNSS baseline big: 330.3km"

32.1.5 Restrictions

The following restrictions apply to DGPS mode:

- The DGPS solution will only include measurements from satellites for which DGPS corrections were provided. This is because the navigation algorithms cannot mix corrected with uncorrected measurements.
- [SBAS corrections](#) will not be applied when using RTCM correction data.
- Precise Point Positioning will be deactivated when using RTCM correction data.
- RTCM correction data cannot be applied when using *AssistNow Offline* or *AssistNow Autonomous*.

32.1.6 Reference

The RTCM2 support is implemented according to RTCM 10402.3 ("RECOMMENDED STANDARDS FOR DIFFERENTIAL GNSS").

32.2 RTCM3

(Note: the RTCM3 protocol is not supported in [protocol versions less than 20](#)).

32.2.1 Introduction

| | |
|---|--|
|  | This feature is only available with High Precision GNSS products. |
|  | This feature is only applicable to GPS, GLONASS or BeiDou operation. |
|  | This feature supports carrier phase differential positioning. |
|  | For effective differential positioning accuracy, it is necessary that the reference station antenna is situated in a low multipath environment with an unobstructed view of the sky and continuous phase lock on all visible satellites. |
|  | RTCM3 messages can also be transmitted through NTRIP (Networked Transport of RTCM via Internet Protocol). u-center incorporates an NTRIP client and an NTRIP server/caster. |

32.2.2 Supported Messages

The following RTCM 3.2 input messages are supported:

Supported RTCM 3.2 Input Messages

| Message Type | Description |
|--------------|---------------------------------------|
| 1001 | L1-only GPS RTK observations |
| 1002 | Extended L1-only GPS RTK observations |
| 1003 | L1/L2 GPS RTK observations |
| 1004 | Extended L1/L2 GPS RTK observations |

Supported RTCM 3.2 Input Messages continued

| Message Type | Description |
|--------------------------------------|--|
| 1005 | Stationary RTK reference station ARP |
| 1006 | Stationary RTK reference station ARP with antenna height |
| 1007 | Antenna descriptor |
| 1009 | L1-only GLONASS RTK observations |
| 1010 | Extended L1-only GLONASS RTK observations |
| 1011 | L1/L2 GLONASS RTK observations |
| 1012 | Extended L1/L2 GLONASS RTK observations |
| 1074 | GPS MSM4 |
| 1075 | GPS MSM5 |
| 1077 | GPS MSM7 |
| 1084 | GLONASS MSM4 |
| 1085 | GLONASS MSM5 |
| 1087 | GLONASS MSM7 |
| 1124 | BeiDou MSM4 |
| 1125 | BeiDou MSM5 |
| 1127 | BeiDou MSM7 |
| 1230 | GLONASS code-phase biases |
| 4072, sub-type 0 | Reference station PVT (u-blox proprietary RTCM Message) |

The following RTCM 3.2 output messages are supported:

When configuring RTCM output messages using the UBX protocol message [CFG-MSG](#), the Class/Ids shown in the table shall be used.

Supported RTCM 3.2 Output Messages

| Message Type | Cls/ID | Description |
|--------------------------------------|-----------|---|
| 1005 | 0xF5 0x05 | Stationary RTK reference station ARP |
| 1074 | 0xF5 0x4A | GPS MSM4 |
| 1077 | 0xF5 0x4D | GPS MSM7 |
| 1084 | 0xF5 0x54 | GLONASS MSM4 |
| 1087 | 0xF5 0x57 | GLONASS MSM7 |
| 1124 | 0xF5 0x7C | BeiDou MSM4 |
| 1127 | 0xF5 0x7F | BeiDou MSM7 |
| 1230 | 0xF5 0xE6 | GLONASS code-phase biases |
| 4072, sub-type 0 | 0xF5 0xFE | Reference station PVT (u-blox proprietary RTCM Message) |

32.2.3 u-blox Proprietary RTCM Messages

The RTCM message type 4072 is the u-blox proprietary RTCM message. It is supported by the RTCM standard version 3.2 and above.

32.2.3.1 Sub-Types

There are different available sub-types of the RTCM message type 4072. The table below shows the available RTCM 4072 sub-types.

RTCM 4072 Sub-Types

| Sub-Type | Message Type Number | Sub-Type Number | Description | Message Data (Payload)Length (bits) |
|----------|---------------------|-----------------|-----------------------|-------------------------------------|
| 0 | 0xFE8 | 0x000 | Reference station PVT | 1008+48*(no. of constellations - 1) |

32.2.3.1.1 Sub-Type 0 (0xFE8 0x000)

RTCM Message type 4072, sub-type 0: Reference station PVT

32.2.4 Configuration

The configuration of the RTK rover and reference station is explained in the [RTK Mode Configuration](#) section.

The RTCM3 protocol can be disabled/enabled on communication interfaces by means of the [UBX-CFG-PRT](#) message. By default, RTCM3 is enabled.

The configuration of the RTCM3 correction stream must be done according to the following rules:

- The RTCM3 stream must contain only one reference station message (type 1005, type 1006, or [type 4072, sub-type 0](#)) in addition to the GPS, GLONASS or BeiDou observation messages.
- All observation messages must be broadcast at the same rate.
- The reference station ID field in the GPS, GLONASS or BeiDou observation messages must be consistent with the reference station ID field in the reference station message otherwise the rover will not be able to compute its position.
- The RTCM3 stream must contain the GLONASS code-phase biases message (type 1230) otherwise the GLONASS ambiguities can only be estimated as float, even in RTK fixed mode.
- The static reference station message (type 1005 or type 1006) does not need to be broadcast at the same rate as the observation messages but the rover will not be able to compute its position until it has received a valid reference station message.
- The moving baseline reference message ([type 4072, sub-type 0](#)) must be broadcast at the same rate as the observation messages.
- The RTCM3 stream should only contain one type of observation messages per constellation. When using a multi-constellation configuration, all constellations should use the same type of observation messages. Mixing RTK and MSM messages will result in undefined rover behavior.
- The moving baseline reference message ([type 4072, sub-type 0](#)) must be used in combination with MSM7 observation messages.
- If the receiver is configured to output RTCM messages on several ports, they must all have the same RTCM configuration otherwise the MSM multiple message bit might not be set properly.

32.2.5 Output

RTK Rover and MB Rover Modes will result in following modified output:

- [NMEA-GGA](#): The quality field will be 4 for RTK fixed and 5 for RTK float (see [NMEA Positon Fix Flags](#)). The age of differential corrections and reference station ID will be set.
- [NMEA-GLL](#), [NMEA-VTG](#): The posMode indicator will be D for RTK float and RTK fixed (see [NMEA Positon Fix Flags](#)).
- [NMEA-RMC](#), [NMEA-GNS](#): The posMode indicator will be F for RTK float and R for RTK fixed (see [NMEA Positon Fix Flags](#)).
- [UBX-NAV-PVT](#): The carrSoln flag will be set to 1 for RTK float and 2 for RTK fixed.
- [UBX-NAV-RELPOSNE](#): The diffSoln and refPosValid flags will be set. The carrSoln flag will be set to 1 for RTK float and 2 for RTK fixed. In moving baseline rover mode, the isMoving flag will be set, and the

refPosMiss and refObsMiss flags will be set for epochs during which extrapolated reference position or observations have been used.

- **UBX-NAV-SAT**: The diffCorr flag will be set for satellites with valid RTCM data. The rtcmCorrUsed, prCorrUsed, and crCorrUsed flags will be set for satellites for which the RTCM corrections have been applied. In moving baseline rover mode, the doCorrUsed flag will also be set.
- **UBX-NAV-STATUS**: The diffSoln flag will be set; the diffCorr flag will be set.
- If the baseline exceeds 10km and a message type 1005, type 1006 or [type 4072, sub-type 0](#) is received, a **UBX-INF-WARNING** will be output, e.g. "WARNING: DGNSS baseline big: 12.7km"

32.2.6 Reference

The RTCM3 support is implemented according to RTCM STANDARD 10403.2 DIFFERENTIAL GNSS (GLOBAL NAVIGATION SATELLITE SYSTEMS) SERVICES - VERSION 3.

Appendix

A Satellite Numbering

A summary of all the SV numbering schemes is provided in the following table.

Satellite numbering

| GNSS Type | SV range | UBX gnssId:svId | UBX svId | NMEA 2.X-4. 0 (strict) | NMEA 2.X-4.0 (extended) | NMEA 4.1+ (strict) | NMEA 4.1+ (extended) |
|-----------|------------|-----------------|---------------|---------------------------|----------------------------|-----------------------|-------------------------|
| GPS | G1-G32 | 0:1-32 | 1-32 | 1-32 | 1-32 | 1-32 | 1-32 |

| QZSS | Q1-Q5 | 5:1-5 | 193-197 | - | 193-197 | - | 193-197 |
| GLONASS | R1-R32, R? | 6:1-32, 6:255 | 65-96, 255 | 65-96, null | 65-96, null | 65-96, null | 65-96, null |

B u-blox 8 / u-blox M8 Default Settings

The default settings listed in this section apply to u-blox 8 / u-blox M8 receivers. These values assume that the default levels of the configuration pins have been left unchanged and no setting that affects the default configuration was written to the eFuse. Default settings are dependent on the configuration pin and eFuse settings. For information regarding these settings, consult the applicable Data Sheet.

If nothing else is mentioned, the default settings apply to u-blox 8 and u-blox M8 receivers.

B.1 Antenna Supervisor Settings (UBX-CFG-ANT)

For parameter and protocol description see section [UBX-CFG-ANT](#).

Antenna Supervisor Default Settings

| Parameter | SPG 2.xx | SPG 3.xx, HPG 1.xx | ADR 3.xx, ADR 4.xx, UDR 1.xx | FTS 1.xx | TIM 1.0x | TIM 1.1x |

B.4 INF Messages Settings (UBX-CFG-INF)

For parameter and protocol description see section [UBX-CFG-INF](#).

B.4.1 UBX Protocol

INF Messages Default Settings for UBX protocol

| Parameter | <i>SPG 2.xx, SPG 3.xx, FTS 1.xx, TIM 1.xx, HPG 1. xx</i> | <i>ADR 3.xx, ADR 4.xx, UDR 1.xx</i> |
|--------------------|--|-------------------------------------|
| infMsgMask-ERROR | 0,0,0,0,0,0 | 1,1,1,1,1,1 |
| infMsgMask-WARNING | 0,0,0,0,0,0 | 1,1,1,1,1,1 |
| infMsgMask-NOTICE | 0,0,0,0,0,0 | 1,1,1,1,1,1 |
| infMsgMask-TEST | 0,0,0,0,0,0 | 1,1,1,1,1,1 |
| infMsgMask-DEBUG | 0,0,0,0,0,0 | 1,1,1,1,1,1 |

B.4.2 NMEA Protocol

INF Messages Default Settings for NMEA protocol

| Parameter | SPG 2.xx, TIM 1.0x, FTS 1.xx | SPG 3.xx, TIM 1.1x, HPG 1.xx | ADR 3.xx, ADR 4.xx, UDR 1.xx |
|--------------------|---------------------------------|---------------------------------|------------------------------|
| infMsgMask-ERROR | 1,1,1,1,1,1 | 1,1,0,1,1,0 | 0,0,0,0,0,0 |
| infMsgMask-WARNING | 1,1,1,1,1,1 | 1,1,0,1,1,0 | 0,0,0,0,0,0 |
| infMsgMask-NOTICE | 1,1,1,1,1,1 | 1,1,0,1,1,0 | 0,0,0,0,0,0 |
| infMsgMask-TEST | 0,0,0,0,0,0 | 0,0,0,0,0,0 | 0,0,0,0,0,0 |
| infMsgMask-DEBUG | 0,0,0,0,0,0 | 0,0,0,0,0,0 | 0,0,0,0,0,0 |

B.5 Jammer/Interference Monitor Settings (UBX-CFG-ITFM)

For parameter and protocol description see section [UBX-CFG-ITFM](#).

Jamming/Interference Monitor Default Settings

| Parameter | SPG 2.xx, SPG 3.xx, ADR 3.xx, FTS 1.xx, TIM 1.xx, ADR 4.xx, UDR 1.xx, HPG 1.xx |
|--------------------|--|
| config-bbThreshold | 3 |
| config-cwThreshold | 15 |
| config-enable | 0 |
| config2-antSetting | 0 |
| config2-enable2 | 0 |

B.6 Logging Settings (UBX-CFG-LOGFILTER)

For parameter and protocol description see section [UBX-CFG-LOGFILTER](#).

Logging Default Settings

| Parameter | SPG 2.xx, SPG 3.xx, ADR 3.xx, FTS 1.xx, TIM 1.xx, ADR 4.xx, UDR 1.xx, HPG 1.xx |
|------------------------------|--|
| flags-recordEnabled | 0 |
| flags-psmOncePerWakeupEnable | 0 |
| flags-applyAllFilterSettings | 0 |
| minInterval | 0 |
| timeThreshold | 0 |
| speedThreshold | 0 |
| positionThreshold | 0 |

B.7 Navigation Settings (UBX-CFG-NAV5)

For parameter and protocol description see section [UBX-CFG-NAV5](#).

Navigation Default Settings

| Parameter | SPG 2.xx | SPG 3.xx | ADR 3.xx, ADR 4.xx, UDR 1.xx | FTS 1.xx | TIM 1.0x | TIM 1.1x | HPG 1.xx |

Related Documents

Overview

As part of our commitment to customer support, u-blox maintains an extensive volume of technical documentation for our products. In addition to product-specific data sheets and integration manuals, general documents are also available. These include:

- GPS Compendium, Docu. No [GPS-X-02007](#)
- GPS Antennas - RF Design Considerations for u-blox GPS Receivers, Docu. No [GPS-X-08014](#)

Our website www.u-blox.com is a valuable resource for general and product specific documentation.

For design and integration projects the Receiver Description Including Protocol Specification should be used together with the Data Sheet and Hardware Integration Manual of the GNSS receiver.

Revision History

| Revision | Date | Name | Status / Comments |
|----------|-------------|------|---|
| R01 | 30-Sep-2013 | efav | Added u-blox M8 firmware 2.00 |
| R02 | 01-Nov-2013 | efav | Added u-blox M8 firmware 2.01 |
| R03 | 15-Dec-2013 | efav | Added u-blox M8 ADR product variant |
| R04 | 10-Feb-2014 | efav | Added u-blox M8 Time & Frequency Sync product variant |
| R05 | 27-Jun-2014 | efav | Added u-blox M8 Timing product variant |
| R06 | 09-Sep-2014 | mfre | Minor corrections |
| R07 | 09-Sep-2014 | mfre | Added u-blox M8 firmware 2.30 |
| R08 | 19-Nov-2014 | mfre | Added u-blox M8 L-type modules product variant |
| R09 | 30-Nov-2015 | mfre | Added u-blox 8 / u-blox M8 SPG 3.01 firmware |
| R10 | 15-Feb-2016 | mfre | Added u-blox 8 / u-blox M8 TIM 1.10 firmware |
| R11 | 04-May-2016 | mfre | Added u-blox 8 / u-blox M8 ADR 4.00 and UDR 1.00 firmware |
| R12 | 28-Apr-2017 | jhak | Added u-blox 8 / u-blox M8 ADR 4.10, HPG 1.40 and SPG 3.51 firmware |
